CHAPTER 1

Introduction

This chapter presents the following topics:

- Solution overview .......................................................... 6
- Scope ............................................................................... 6
- Assumptions ..................................................................... 6
Solution overview

IndigoVision video management software (VMS) for video surveillance is scalable, provides sensor integration, and is standards-based for open integration. IndigoVision VMS incorporates smart technology to automatically detect, analyze, and classify behaviors of people and vehicles. This solution is ideally coupled with Isilon Scale-out NAS storage. These options provide the customer with exceptional performance and reliability creating a successful implementation.

The purpose of this Configuration Guide is to help Dell EMC field personnel understand how to configure Dell EMC storage system offerings to simplify IndigoVision Control Center implementation. This document is not a replacement for the IndigoVision implementation guide nor is the document a replacement for the Dell EMC sizing guides.

IndigoVision Control Center provides a comprehensive system for video surveillance. This system enables customer’s network and security teams to collaborate effectively in a highly scalable environment that combines video and network techniques to optimize the experience. The Dell EMC storage system provides no single point of failure while the IndigoVision Control Center design ensures resilience.

Scope

This guide is intended for internal Dell EMC personnel and qualified Dell EMC and VMS (partner) partners. It provides configuration instructions for installing the VMS (long) video management software using Dell EMC storage platforms.

The following Dell EMC storage systems have been tested:

- Dell EMC Isilon™

This guide supplements the standard Dell EMC Isilon Storage Best Practices with Video Management Systems: Configuration Guide and provides configuration information specific to the VMS.

Note

All performance data in this guide was obtained in a rigorously controlled environment. Performance varies depending on the specific hardware and software used.

Assumptions

This solution assumes that internal Dell EMC personnel and qualified Dell EMC partners are using this guide with an established architecture.

This guide assumes that the Dell EMC partners who intend to deploy this solution are:

- Associated with product implementation
- VMS (partner)-certified to install VMS (long) services
- Proficient in installing and configuring Isilon storage solutions
- Familiar with installing and configuring VMware hypervisors and the appropriate operating system, such as Microsoft Windows or a Linux distribution
- Able to access the Dell EMC Isilon Storage with Video Management Systems: Configuration Guide

The configurations that are documented in this guide are based on tests that we conducted in the Dell EMC Surveillance Lab using worst-case scenarios to establish a
performance baseline. Lab results might differ from individual production implementations.
CHAPTER 2

Configuring the solution

This chapter presents the following topics:

- Design concepts........................................................................................................... 10
- Isilon (NAS)................................................................................................................ 10
- Configuring IndigoVision NVR-AS servers with the AD domain controller .......... 15
- Configuring the IndigoVision NVR-AS service to automatically restart .......... 16
- Releases tested ............................................................................................................. 17
Design concepts

There are many design options for an IndigoVision Control Center implementation. These design details are beyond the scope of this paper.

The IndigoVision Control Center Release 13.1 provides the information that you need to plan a IndigoVision Control Center system. The document is available from an IndigoVision partner or through indigovision.com. This configuration guide is not intended to replace or supersede any IndigoVision document.

This guide is intended for systems integrators and architects, network IT planners, and system administrators. The guides assume that readers know what IndigoVision Control Center does and how it works, and know how to deploy and configure Windows IP networks.

The following figure represents the basic configuration that was tested in our lab for this solution.

Figure 1 IndigoVision Control Center architecture

Isilon (NAS)

The Isilon scale-out network-attached storage (NAS) platform combines modular hardware with unified software to harness unstructured data. Powered by the distributed Isilon OneFS™ operating system, an Isilon cluster delivers a scalable pool of storage with a global namespace.

The platform's unified software provides centralized web-based and command-line administration to manage the following features:

- A symmetrical cluster that runs a distributed file system
- Scale-out nodes that add capacity and performance
- Storage options that manage files and tiering
- Flexible data protection and high availability
- Software modules that control costs and optimize resources

Data protection

In the Isilon N+M data protection model, N represents the number of nodes, and M represents the number of simultaneous node, drive, or a combination of node and
drive failures that the cluster can withstand without incurring data loss. N must be larger than M.

Isilon OneFS supports N+1, N+2, N+3, and N+4 data protection schemes, and up to 8x mirroring. OneFS also supports several hybrid protection schemes. These include N +2:1 and N+3:1, which protect against two drive failures or one node failure, and three drive failures or one node failure, respectively.

The following best practices are based on a five-node minimum cluster size. You can use cluster sizes as small as a three-node cluster, but Dell EMC does not recommend this.

- Our five-node cluster lab tests were based on the Isilon recommended +2:1 protection level for this node count range. Larger node-count clusters have more disks, which cause an increase in the possibility of multiple disk failures. For larger clusters, consult the Isilon team or your Isilon representative for appropriate protection schemes: N+2:1, N+2, N+3, or N+4.
- Include a minimum free space calculation for proper cluster sizing. Dell EMC recommends a cluster size that enables a node to be removed, while retaining a minimum of 10 percent free space in the remaining capacity. This free space ensures that node removal and node failures have minimal or no impact on video ingestion.

An Isilon sizing tool provides a more accurate calculation. You can find this tool at https://isilon-lawndart.herokuapp.com/pools/search. Other sizing tools are available for sizing bandwidth and storage capacity needed.

Impact policy and priority configuration

The impact policy defines the number of parallel tasks or workers that can run at one time within OneFS. Leave the impact policy as it is, unless Isilon directs you to change one or more policies.

Releases with OneFS 7.0 or greater

Dell EMC recommends using OneFS 7.0 or later to maximize bandwidth and minimize video review response times. You can use the default impact policy with Isilon X400, Isilon X410, Isilon NL410, and greater. For less powerful nodes, such as the Isilon X200 and earlier running OneFS 7.0 or greater, modify all jobs to use an impact policy of Low.

Releases prior to OneFS 7.0

For releases prior to OneFS 7.0, the best I/O performance is obtained by configuring all background jobs with the impact policy set to Low. To set the impact policy select Operations > Jobs and Impact Policies.

Priority configuration

Even if the impact policy is modified, for example, by changing the settings of all the jobs to Low, the priority of the jobs remains at their default settings.

Volume limits

Implementations greater than 8 TB are common when video is stored on high-end storage, such as Isilon scale-out NAS storage. The clustered file system OneFS uses enables Isilon to handle these large volumes.
Large file system, small view (SmartQuotas)

Although it is possible to assign the full Isilon cluster file system to a single VMS (partner) Recorder, the Dell EMC best practice is to use SmartQuotas™ to segment the single Isilon file system so that each Recorder has a logical subset view of storage.

There are three directory-level quota systems:

- **Advisory limit**
  - Lets you define a usage limit and configure notifications without subjecting users to strict enforcement.

- **Soft limit**
  - Lets you define a usage limit, configure notifications, and specify a grace period before subjecting users to strict enforcement.

- **Hard limit (recommended)**
  - Lets you define a usage limit for strict enforcement and configure notifications. For directory quotas, you can configure storage users' view of space availability as reported through the operating system.

  Use the **Hard limit** quota system to set the video storage as a defined value.

  If necessary, both Isilon and the VMS (partner) Recorder can add or subtract storage, even if a hard quota is set.

Configuring SmartQuotas (recommended)

The SmartQuotas feature enables you to limit the storage that is used for each VMS (partner) Recorder. It presents a view of available storage that is based on the assigned quota to the Recorder. SmartQuotas enables each Recorder to calculate its available disk space and react appropriately.

Without SmartQuotas, the VMS (base) administrator must anticipate the total write rate to the cluster and adjust the **Min Free Space** on each Recorder accordingly. A miscalculation can result in lost video. SmartQuotas resolves the issues that can be caused by manual calculations.

Configure SmartQuotas when more than one Recorder is writing to the Isilon cluster, or when other users share the cluster. Enable SmartQuotas and define a quota for each share or directory.

Configure the SmartQuotas setup with the following settings:

- Configure a hard share limit threshold to the Recorder video files.
- Define OneFS to show and report the available space as the size of the hard threshold.
- Set the usage calculation method to show the user data only.

**Procedure**

1. From the OneFS GUI, select **File System Management > SmartQuotas**.
2. For each listed share, select **View details**.
3. Under **Usage Limits**, select **Edit usage limits**.
4. Define the SmartQuotas limit and set the threshold:
   a. Select **Specify Usage Limits**.

b. Select **Set a hard limit**.

c. Type the hard limit value.

d. Select the size qualifier, typically TB.

e. Select the size of the hard threshold.

5. Click **Save**.

6. Repeat the process for the remaining shares.

**Unique share naming**

When working with a single file system, each NVR-AS uses the time and date as part of its directory and file-naming conventions.

To avoid corruption caused by overwriting or grooming (deleting) files prematurely, create a unique share for each NVR-AS.

**Configuring SmartConnect (optional)**

SmartConnect™ uses the existing Domain Name Service (DNS) Server and provides a layer of intelligence within the OneFS software application.

The resident DNS server forwards the lookup request for the delegated zone to the delegated zone's server of authority, which is the SmartConnect Service IP (SIP) address on the cluster. If the node providing the SmartConnect service becomes unavailable, the SIP address automatically moves to a different node in the pool.

Connections are balanced across the cluster, which ensures optimal resource utilization and performance. If a node goes down, SmartConnect automatically removes the node's IP address from the available list of nodes, ensuring that a connection is not tried with the unavailable node. When the node returns to service, its IP address is added to the list of available nodes.

The delegated server authority is always the node with the lowest ID, unless it has surrendered its authority status, either voluntarily or involuntarily. This node should always be available, but if the status of the node changes and becomes unavailable, it voluntarily surrenders its role as server of authority.

You must add a delegation Name Server (NS) entry to the resident DNS server for the SmartConnect name, which points to the SIP address as the Name Server. In your DNS Manager, create a **New Delegation** using your SmartConnect zone name. In the Microsoft DNS wizard, a New Delegation record is added in the forward lookup zone for the parent domain.

SmartConnect balances connection loads to the Isilon cluster and handles connection failover. With SmartConnect, all IndigoVision NVR-AS servers use a single fully qualified domain name (FQDN) or universal naming convention (UNC) path for video storage access. Using this network name provides load balancing when the connection to the cluster is made and simplifies installations.

SmartConnect Basic can use a round-robin-type connection allocation, which is based on DNS load balancing.

SmartConnect Advanced can include multiple pools for each subnet, Dynamic IP addresses for NFS, and the following load-balancing options (Connection policy and Rebalance policy):

- **Round-robin (recommended)**
  
  Sequentially directs a connection to the next Isilon IP address in the cycle. Based on field reports, this option works well with 20 servers or more.
**Connection count**

Provides uniform distribution of the IndigoVision NVR-AS servers to specified nodes in the Isilon cluster. Use a unique IP address pool for video recording and NVR-AS read/write access.

**Network throughput**

Based on NIC utilization. Use of throughput requires that each NVR-AS is activated, configured, and recording video after it connects to Isilon.

**CPU usage**

Uses the node CPU utilization to determine which Isilon IP address to assign to the next connection request.

Ensure that no other service uses the NVR-AS IP address pool. Define additional pools for management (such as Isilon InsightIQ™ or administrative access), evidence repository, post process, or other use.

**Procedure**

1. Select **Networking Configuration**.
2. Under **Subnet > Settings**, define the SmartConnect service IP (SSIP) address. The SSIP address is the IP address that the DNS uses for the Isilon Authoritative name service.
3. Under **Pool settings**:
   a. Define the SmartConnect zone name, which is the name to which clients connect.
   b. Define the SmartConnect service subnet (the subnet that has the SSIP configured on the DNS server).
   c. Define the connection balancing policy to **Round Robin**.
   d. Set the IP allocation strategy to **Static**.
4. Verify this configuration on the SmartConnect dashboard.

**I/O optimization configuration**

As of OneFS 7.0.x, no changes are necessary to the I/O profiles for the directories that are used for IndigoVision.

---

**Note**

This setting does not require a SmartPool license.

**Configuring authentication and access control**

We conducted authentication and access control tests to determine the best method for shared access.

The following three tests were conducted:

**Full Active Directory (recommended)**

Where the VMS (base) server and the Isilon cluster are part of the same Windows domain.

**Partial Active Directory**

Where the VMS (base) servers are part of the Windows domain, but the Isilon cluster is administered locally.
Fully locally administered control
Where the VMS (base) servers and the Isilon cluster are administered locally.

Alternatives to the previous methods might exist, but the Dell EMC Surveillance Lab team does not plan to derive or support other methods.

Procedure
2. Select Access zone and ensure that the System access zone has the provider status Active Directory, Local, and File marked with a green dot.
3. Under Active Directory, select Join a domain and add the Windows domain and appropriate users using one of the following options:
   - When the Isilon cluster and VMS (partner) are not part of the same domain, set the shares to Run as Root. This setting is not ideal from a security perspective.
   - When the Isilon cluster and VMS (short) server are part of the same domain, configure the DVM Camera service to use the Domain account with read/write permissions to the Isilon cluster share. During the initial installation of the camera server, use the VMS (short) administrator account specification wizard to configure the camera service. Specify the recording location for the camera server using the full UNC path of the Isilon share.

Configuring IndigoVision NVR-AS servers with the AD domain controller

Although local user account authentication is available, we configured Active Directory (AD) user account authentication in the lab to simplify user management.

AD is a distributed directory service included with several Windows Server operating systems; it identifies resources on a network in order for users or applications to access them. If you wish to add users through the AD service, you must have a server with AD installed and acting as the domain controller on your network. Consult your network administrator regarding use of AD with your IndigoVision Control Center environment.

To configure IndigoVision NVR-AS servers with AD Domain Controller:

Procedure
1. Ensure that there is a server with AD installed and acting as the domain controller on the network.
2. Add all recording servers, management hosts, and the Isilon cluster to the available domain controller.
3. Log in as the Domain user on the host.
4. In Windows Services, select IndigoVision NVR-AS service.
   - Click the Log On tab and update the credentials for the Active Directory user.
5. Restart the service.
Configuring the IndigoVision NVR-AS service to automatically restart

The NVR-AS application carries out a periodic check to see that the storage is still available for writes. If the storage is not available to write the camera recordings due to network failure or some problem in the storage, the NVR-AS service shuts down completely. NVR-AS server does this to force a failover operation.

During the NIC failure, node power-off and node smartfail tests were run with smartconnect configured in the Dell EMC Surveillance Lab. If the NIC connection or the node is down, NVR-AS service shut down completely and didn't restart automatically even after the connection and storage are restored on the NVR-AS server.

If the NIC connection or the node is down, the NVR-AS service shut down completely and did not automatically restart even after the connection and storage were restored on the NVR-AS server.

The work around for this behavior is to reconfigure the IndigoVision NVR-AS service to automatically restart.

Procedure

1. Open the IndigoVision NVR-AS service properties window and select the Recovery tab.
2. Select Enable actions for stops with errors.

Results

Enables the 'IndigoVision NVR-AS' service to run continuously and continue writing to the storage when the connection is restored and storage is available for writing.

The following figure shows the setting on the NVR-AS service Recovery tab to restart the service that was stopped due to errors.
Figure 2 NVR-AS service workaround for restart

Releases tested

The following tables list the firmware builds and software releases used for our tests.

Configuring the solution
This chapter presents the following topics:

- **Summary**

20
Summary

Dell EMC performed comprehensive testing with IndigoVision Control Center against Dell EMC Isilon clusters. Depending on the implementation needs, you can use Dell EMC storage for IndigoVision Control Center. The IndigoVision Control Center architecture and product suite enables extreme scaling from a few cameras to tens of thousands of cameras using Dell EMC storage.

**Dell EMC Isilon scale-out storage**

Isilon scale-out storage is ideal for midtier and enterprise customers. An Isilon cluster is based on independent nodes working seamlessly together to present a single file system to all users.

Licensed SmartQuotas options can be configured so that each NVR-AS view of the storage is based on the assigned quota and not the entire file system. Dell EMC recommends using SmartQuotas with IndigoVision Control Center as a best practice.
