Future-Proof, End-to-End NVMe

PowerMax offers unprecedented performance with a future-proof, [end-to-end NVMe](#) multi-controller architecture. The key to driving new levels of performance is NVMe, a high-performance protocol designed for modern media. NVMe was architected to take advantage of the parallelism of modern multicore CPUs and SSDs to overcome the limitations of storage protocols designed for hard disk drives (SCSI-based protocols like SAS).

NVMe maximizes the power of a multi-controller all-flash array and, more importantly, opens the door to the next media disruption with support for storage class memory (SCM)*. SCM will offer an order of magnitude better performance—bridging the performance gap between flash drives and volatile memory (DRAM). PowerMax supports industry standard NVMe flash drives, is SCM ready, and will offer host connectivity via NVMe over Fabric (NVMeoF)*.

Smart Software

PowerMaxOS is the only storage operating system optimized for next-generation media—bringing autonomous storage to life with a built-in machine learning engine.

Built-in machine learning engine automatically optimizes data placement

**SCM and NVMe-oF available in 2019*

The machine learning engine is designed to automatically place data on the correct media type (flash or SCM) based on the IO profile by analyzing and forecasting an average of 40 million data sets per array that drive over 6 billion decisions per day. The engine uses predictive analytics and pattern recognition to maximize performance with no management overhead. Dell EMC is the only company that can deliver this level of intelligence currently analyzing over 425 billion data sets in real-time across the installed base with zero management overhead.

PowerMax arrays are built for simplicity and include appliance-based packaging with either the Essentials or Pro software package—adding enhanced security, remote replication, eNAS, optimization, and management features.

Extreme Efficiency

PowerMax delivers extreme efficiency with inline deduplication and compression delivering up to 5:1 data reduction (3:1 average), space efficient snaps, and thin provisioning. Its inline deduplication and compression have virtually zero impact on performance, can be used with all data services, and are turned on/off by application. Another reason why PowerMax was rated 2018 Product of the year by CRN.

PowerMax inline deduplication and compression

Non-Disruptive Migration

To enable users to take advantage of this platform as quickly as possible, PowerMax provides seamless, non-disruptive migration from VMAX arrays and simple migration from third-party arrays.

Non-Disruptive Tech Refresh from VMAX

Massive Scale and Consolidation

PowerMax is built to handle high demand, heavy transaction workloads while storing petabytes of vital data. Each PowerMax brick has one engine, one to two DAEs, and fully redundant components. The multi-dimensional scale enables millions of IOPS, petabytes of effective capacity, and hundreds of front-end ports.

PowerMax enables massive consolidation with support for mixed environments: open systems applications, mainframe, IBM i, and file storage on the same array—simplifying operations and significantly lowering TCO.

Massive Consolidation

Mission-Critical Availability

PowerMax is designed for six-nines of availability in the most demanding, mission-critical environments. SRDF software, the gold standard in disaster recovery, offers unmatched flexibility and massive scalability to deliver remote replication over extended distances or across multiple sites. For continuous availability with zero down time, SRDF/Metro enables true active-active data center replication. PowerMax also offers no single points of hardware failure and hot swappable components to extend availability.

Reliable Data Protection

SnapVX provides zero-impact, space-efficient local snapshots that can be used for local protection and recovery or that can be repurposed for other use cases including development/test, analytics, backups, and patching. SnapVX secure snapshots prevent accidental or malicious deletion of your snapshots, securing them until they reach their specified retention period. In addition, integrated copy data management (iCDM) provides exceptional customer value by enabling application-consistent, on-array copy orchestration with critical applications like Oracle and VMware, enabling operational recovery and copy repurposing.

In addition, Dell EMC Storage Direct technology enables self-service data protection and up to 20 times faster backup and 10 times faster recovery by enabling backup directly from PowerMax to a Dell EMC Data Domain system. And Dell EMC RecoverPoint is available to provide heterogeneous replication support and recovery to any point in time.

Proven Security

PowerMax offers stringent security features to ensure businesses can meet corporate governance and compliance requirements and work across all available data services so that no tradeoffs need to be made. PowerMax data-at-rest encryption (ready for FIPS 140-2 validation) secures every drive and delivers integration with external key managers, enabling customers to simplify security through a centralized key management platform. Tamper proof audit logs allow IT managers to quickly identify unwanted activity and feel confident in the accuracy of the original PowerMax logs.

Simplified Management

Unisphere for PowerMax is an intuitive management interface that allows IT managers to maximize human productivity by dramatically reducing the time required to provision, manage, and monitor PowerMax storage assets.

Based on HTML 5, Unisphere delivers the simplification, flexibility, and automation that are key requirements to accelerate the transformation to the modern data center.
