As part of an effort to for product improvement, revisions of software and hardware are periodically released.

Therefore, some functions described in this document might not be supported by all versions of the software or hardware currently in use. The product release notes provide the most up-to-date information on product features, software updates, software compatibility guides, licensing, and services.

Contact your technical support professional if a product does not function properly or does not function as described in this document.

Note
This document was accurate at publication time. Go to the support site (https://support.emc.com) to make sure that you are using the latest version of this document.

Purpose
This guide describes how to install and use Data Domain Management Center (DD Management Center) features and tools.

Audience
This guide is intended for use by both system administrators and general users of DD Management Center.

Related documentation
The Data Domain Management Center Release Notes provides additional information on this release.

For additional information about Data Domain systems, see:
- The Data Domain Operating System software documentation set
- The Data Domain system installation and setup guides for each of your Data Domain platforms.

Special notice conventions used in this document
The following conventions for special notices are used:

NOTICE
A notice identifies content that warns of potential business or data loss.

Note
A note contains information that is incidental, but not essential, to the topic.

Typographical conventions
The following type style conventions are used in this document:

Table 1 Typographical conventions

| **Bold** | Indicates interface elements, such as names of windows, dialogs, buttons, fields, tab names, key names, and menu paths |
Table 1 Typographical conventions (continued)

*Italic* Highlights publication titles referenced in text

*Monospace* Indicates system information, such as:
- System code
- System output, such as an error message or script
- Pathnames, filenames, prompts, and syntax
- Commands and options

*Monospace italic* Highlights a variable name that must be replaced with a variable value

*Monospace bold* Indicates text for user input

[] Indicates optional values

| Indicates alternate selections - the bar means “or”

{} Indicates content that the user must specify, such as x or y or z

... Indicates nonessential information omitted from the example

**Where to get help**

Information about software documentation, product updates, support, licensing, and more can be found on the online support site (https://support.emc.com).

**Your comments**

Your suggestions help us continue to improve the accuracy, organization, and overall quality of user publications. Send your opinions of this document to DPAD.Doc.Feedback@emc.com.

**Revision history**

CHAPTER 1

DD Management Center Overview

- Introducing Data Domain Management Center .................................................. 10
- Features of DD Management Center ................................................................ 10
- Differences between DD Management Center and DD System Manager .......... 11
Introducing Data Domain Management Center

Data Domain Management Center (DD Management Center) is a scalable, virtual system-based solution for centralized management of multiple Data Domain systems and virtual data protection system (DD VE instances).

- DD Management Center provides current and historical data for all of the managed Data Domain systems, with subject presentation ranging from site-wide summaries to granular detail for a selected object.
- DD Management Center can configure and monitor storage on multiple Data Domain systems with secure multi-tenancy DD Boost backup and replication.
- DD Management Center is composed of a set of browser-based pages and is installed and runs on a VMware, Hyper-V, or public cloud (for example, Amazon Web Services (AWS) or Azure) environment.

Note

Secure multi-tenancy is not supported on DD VE 2.0 instances, but it is supported on DD VE 3.0 and later.

Features of DD Management Center

The robust features of DD Management Center help manage all of the Data Domain systems through one convenient graphical user interface.

These features enable you to:

- Monitor and manage
  - Monitor the health and operation of managed objects on a user-defined dashboard
  - Display site-wide storage capacity, showing aggregated usage totals, including DD Cloud Tier
  - Graph current and historical data about space usage, data consumption, and daily written data trends
  - Manage the Secure Multi-Tenancy (SMT) feature, especially to configure and monitor DD Boost access
  - Monitor operational status of configured replications and set thresholds that generate alerts (sent to the alerts log) when replications lag
  - Manage user access through configurable role-based access control (RBAC) settings

- Estimate and report
  - Estimate projected capacity needs based on historical trends and pinpoint specific dates (both past and future) for usage comparison
  - Generate usage and performance reports, on demand, or set up a schedule and email list to facilitate proactive management
  - Process alerts all managed Data Domain systems, including DD Cloud Tier, and view from a single list
  - EMC Secure Remote Service (ESRS) V3 gateway (GW) integration provides secure transport of messages to Support
• Act simultaneously on multiple Data Domain systems
  ▪ Open a Data Domain System Manager (DD System Manager) session for each managed Data Domain system, simultaneously providing both advanced multiple-system management capabilities with DD Management Center and full single-system management capabilities with DD System Manager
  ▪ Create custom groupings of the managed Data Domain systems, organized efficiently and intentionally
  ▪ Apply groups and properties to managed objects to customize how content is displayed and best represent the infrastructure
  ▪ Configure secure multi-tenancy tenants and tenant units for the managed Data Domain systems individually, or in groups, such as user access and DD OS upgrades

DD Management Center can be deployed on Hyper-V platforms and in public cloud (for example, AWS and Azure) environments.

Differences between DD Management Center and DD System Manager

DD Management Center differs from DD System Manager in the following ways:

• DD Management Center can manage up to 150 Data Domain systems, while DD System Manager is a single-system management tool.
  ▪ DD Management Center includes the ability to manage Data Domain systems with High Availability (HA), Data Domain Cloud Tier (DD Cloud Tier), and Data Domain Virtual Edition (DD VE) instances.
  ▪ DD Management Center can perform upgrade on groups of Data Domain systems, simultaneously and can create, edit, and delete tenants and tenant units.
  ▪ DD Management Center aggregates storage and performance data, as well as compares operational information, for all managed Data Domain systems. DD System Manager does not aggregate storage and/or performance data from multiple systems, nor can you compare operational information across systems.
  ▪ DD Management Center does not directly manage storage. DD System Manager directly manages storage (using VTL, CIFS, NFS, Data Domain Boost, and so on).

CHAPTER 2
Planning the DD Management Center environment

- Data Domain system requirements ................................................................. 14
- Determining VMware requirements ............................................................. 14
- Backing up and restoring ........................................................................... 15
Data Domain system requirements

The virtual machine hardware requirements are provided in this table.

Table 3 Data Domain system requirements

<table>
<thead>
<tr>
<th># of systems managed</th>
<th>virtual CPU (vCPU)</th>
<th>memory (GB)</th>
<th>VM disk SizeBase install + database (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 to 150</td>
<td>4 vCPU</td>
<td>8</td>
<td>40 + 200</td>
</tr>
</tbody>
</table>

Note

The changing of any of the individual components of these settings is not supported, that is, you cannot increase the memory, change the CPU settings, etc.

Determining VMware requirements

VMware requirements include:

- VMware hardware and software system requirements on page 14
- Additional VMware software applications on page 14

VMware hardware and software system requirements

The VMware hardware and software that is required to host a DD Management Center installation can be:

- The vCenter Server installation, which accommodates a variety of virtual machines, of which one is the DD Management Center. The server is where the virtual machines are configured, provisioned, and managed.
- One of the following:
  - ESXi 5.1
  - ESXi 5.5
  - ESXi 6.0
  - ESXi 6.5
- vSphere client, a Windows-based GUI interface that allows users to connect remotely to any of the server types to perform remote management.

Storage for the VMware installation can be provided using:

- NAS (Virtual Disks over NFS)
- SAN (Virtual Disks over VMFS)

High Availability (HA) requirements

If an HA configuration is required, use the VMware software option of your choice to implement this.

Additional VMware software applications

DD Management Center is a VMware vApp. In order to improve the reliability of your DD Management Center installation, you might find the following applications helpful.
**VMware vSphere High Availability (HA)**
VMware vSphere High Availability (HA) provides cost-effective high availability for any application running in a virtual machine, regardless of its operating system or underlying hardware configuration.

**VMware vSphere Fault Tolerance (FT)**
VMware vSphere Fault Tolerance (FT) provides zero downtime, zero data loss, and continuous availability for applications, without the cost and complexity of traditional hardware or software clustering solutions.

**Backing up and restoring**

Any process that creates and restores a *snapshot* of your entire virtual machine can successfully protect your DD Management Center installation.

It is highly recommended that you perform a snapshot before doing an upgrading procedure.

DD Management Center does not depend on having any integration with the backup software.

After the snapshot is restored, DD Management Center automatically performs any necessary application recovery.

Suitable backup software choices would include VMware Data Recovery (VDR), Avamar, etc.

As with any data protection software, make sure to test your setup after you have installed your chosen backup software.

---

**Note**
The use of cloning has not been validated.
Planning the DD Management Center environment
CHAPTER 3
Getting Started

- Prerequisites.......................................................................................................18
- Downloading DDMC............................................................................................18
- Installing DDMC in a VMware environment.........................................................19
- Powering on DD Management Center................................................................36
- Logging in and out of DD Management Center...................................................37
- Continuing DD Management Center configuration.............................................38
- Understanding RBAC in DD Management Center...............................................38
- Viewing DDMC page elements...........................................................................39
- Navigating a DDMC page...................................................................................40
- Organizing the dashboard...............................................................................40
- Organizing managed Data Domain systems.......................................................45
- Assigning properties...........................................................................................52
- Displaying property information.......................................................................53
- Managing groups...............................................................................................54
- Managing replication lag threshold policies......................................................54
- Working with filters............................................................................................55
Prerequisites

Review the chapter Planning the DD Management Center environment on page 13 and ensure the required VMware hardware and software components are in place at the site. The guide also includes descriptions of optional VMware software for backup and reliability that ensures the DD Management Center installation is operating optimally.

Ensure the following are in place:

- VMware vCenter or ESX servers and software
- VMware vSphere client application (VMware vSphere client application are only required if installing on vSphere/vCenter. They are not required for AWS/Azure/Hyper-V/KVM.)
- Sufficient CPU, memory, disk space, and network resources
- If installing within a Hyper-V or cloud environment, and you cannot use role-based credentials, have information on hand to create an access profile.

Downloading DDMC

The DDMC file you use will depend upon the environment in which you are operating.

Note

AWS and Azure are supported through the public domain. You have a choice to directly access files or to download files.

Procedure

1. Download the DDMC files from the online support site as applicable:
   - For ESXi/Vcenter: .ovf file
   - For Hyper-V: ddmc-<version>-hyperv.zip
   - For Azure: ddmc-<version>-azure.zip
   - For AWS: ddmc-aws-<version>-osdisk.vmdk
   - For KVM: ddmc-kvm-<version>.tar.gz

2. Log in to the support site using your existing credentials, or register to obtain your credentials.
3. Select Support by Product below the Search box.
4. Use the Find a Product search box to find Data Domain Management Center.
5. In the list of categories under the Search box, select Downloads.
6. Select the link to download the appropriate version of the software.

After you finish

You can now install the DDMC software on your VMware platform.
Installing DDMC in a VMware environment

There are two procedures for installing the .ovf file and configuring settings for DDMC.

- Installing on a VMware vCenter Server on page 20
- Installing on a VMware ESX server on page 21

Here is a summary of the factory default settings and the settings that can be configured during the configuration procedure.

Table 4 Installation and configuration settings

<table>
<thead>

</tbody>
</table>
Installing on a VMware vCenter Server

**Before you begin**

1. Download the DD Management Center software, as described in [Downloading DD Management Center](#).

2. Open the vSphere client, type the following, and select **Login**:
   - The IP address or hostname of the VMware vCenter Server where DD Management Center will be installed
   - The administrator ID and password for the VMware server

**Note**

The following table corresponds to the VMware wizard.

<table>
<thead>
<tr>
<th>Deployment wizard step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Launch virtual machine deployment wizard</td>
<td>Use the VMware deployment wizard to deploy the DD Management Center instance.</td>
</tr>
<tr>
<td>OVF Template Details</td>
<td>Deploy from the .ovf file or a local file from a network location.</td>
</tr>
<tr>
<td>Name and Location</td>
<td>Optionally type a name (default is “Data Domain Management Center”), and select an installation location. This name identifies the virtual machine on the VMware server. It does not become a hostname on the LAN.</td>
</tr>
<tr>
<td>Deployment Configuration</td>
<td>Default configuration cannot be changed.</td>
</tr>
<tr>
<td>Host/Cluster</td>

</tr>
</tbody>
</table>

Ready to Complete Review the configuration summary and finish the wizard.

This initial configuration cannot be repeated to change settings. After you have completed an initial configuration, you must use the DD Management Center CLI for any settings that you want to change.

**Installing on a VMware ESX server**

**Before you begin**

1. Download the DD Management Center software, as described in [Downloading DD Management Center](#).
2. Open the vSphere client, type the following, and select **Login**:
   - The IP address or hostname of the VMware vCenter Server where DD Management Center will be installed
   - The administrator ID and password for the VMware server
Note
The following table corresponds to the VMware wizard.

Table 6 Installing DD Management Center on a VMware vCenter Server

<table>
<thead>

</tbody>
</table>

This initial configuration cannot be repeated to change settings. After you have completed an initial configuration, you must use the DD Management Center CLI for any settings that you want to change.

Hyper-V

This version of DD Management Center (DDMC) allows you to create virtual machines using Microsoft Hyper-V for Windows.

Deployment requirements for Hyper-V
DDMC in Hyper-V uses 4 CPU, 8G RAM and 250 GB of disk space when deployed.

Set up Hyper-V
Set up Hyper-V by navigating to Microsoft’s Windows Server (2012 R2 or 2016) site and following the instructions found on the install page.

Download the Hyper-V package for DDMC
Go to the support site and download the Hyper-V zip file for your version of DDMC to the Hyper-V server.

Deploying the Hyper-V package for DD Management Center

The Hyper-V package consists of the following:

- `ddmc-installer-sc.ps1`: The script used for the deployment DD Management Center on System Center.
- `README.txt`: Contains additional information about the steps needed to deploy the package.
• ddmc-N.N.N.N-xxxxxx.vhd: The boot disk.
• ddmc-installer-sc.ps1: The script needed for DD Management Center deployment.

Procedure
1. Unzip the ddmc-N.N.N.N-xxxxxx-hyperv.zip package to a folder.
   The script must be downloaded onto the Windows 2012R2 server.
2. Open the Power Shell prompt as an administrator.
3. Run the following script: .\ddmc-installer.ps1

Note
Make sure you have a valid serial number for the DD Management Center virtual machine.

DDMC on kernel-based virtual machine

DDMC on kernel-based virtual machine (KVM) only supports Intel-based processors. The following Linux distributions are supported.

Table 7 Supported Linux distributions

<table>
<thead>
<tr>
<th>Linux distribution</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>RedHat</td>
<td>7.2 and 7.3</td>
</tr>
<tr>

</tr>
<tr>
<td>Ubuntu</td>
<td>14.04 and 16.04</td>
</tr>
</tbody>
</table>

Deploying DDMC on kernel-based virtual machine

Before you begin

Procedure
1. Download and extract the KVM installable Zip file. File name is ddmc-kvm-<branch number>--<build number>.tar.gz.
2. Copy the tar file to the Linux system where KVM is installed, and in partition where VMs are stored. Make a new directory for new DDMC VM.
3. Untar the tar file. It creates a directory.
   This directory has the following files:
   • DDMC_README.txt: Help file for deploying VM on KVM
   • kvm-ddmc-installer.sh: DDMC deployment script, which automatically setups CPU, RAM, DISK, NVRAM configuration
   • ddmc-<branch number>--<build number>.qcow2: Root disk for VM

```
root@ddve-ucs55d:/mnt/ucs55d-das1/ddmc_set/ddmc1# tar -xvf ddmc-kvm-0.6120.12.0-566688.tar.gz
ddmc-kvm-0.6120.12.0-566688/ddmc-kvm-0.6120.12.0-566688/DDMC_README.txt
ddmc-kvm-0.6120.12.0-566688/kvm-ddmc-installer.sh
ddmc-kvm-0.6120.12.0-566688/ddmc-kvm-0.6120.12.0-566688.qcow2
```
4. Run `kvm-ddmc-installer.sh` script to deploy DDMC VM. Once the VM is deployed, it will power on.

```
root@ddve-ucs55d:/mnt/ucs55d-das1/ddmc_set/ddmc1/ddmc-
kvm-0.6120.12.0-566688# ./kvm-ddmc-installer.sh
Distribution:ubuntu Version:16.04
The host version check done.
Basic validation done.
Convert the root disk to raw...
Disk convert done.
root disk:/mnt/ucs55d-das1/ddmc_set/ddmc1/ddmc-
kvm-0.6120.12.0-566688 config type:4TB bridge:br0
Start creating DB disk, it may take a few minutes...
DB disk file has been created successfully.
Domain ddmc-0.6120.12.0-566688 defined from config.xml
Domain ddmc-0.6120.12.0-566688 marked as autostarted
Domain ddmc-0.6120.12.0-566688 started
DDMC instance has been created successfully!
```

5. Log in to the GUI of KVM host. Run `virt-manager` command, and the KVM GUI to manage VMs should appear.

6. Connect to console, and check IP the address. DDMC can now be remotely configured.

Adding DD VE to DDMC

**Procedure**

1. Deploy DD VE on KVM. (For more information, see *Dell EMC Data Domain Virtual Edition Version Installation and Administration Guide*.)

2. Get the IP addresses of the DD VE to be added to DDMC for management.

3. Log in to DDMC. If serial number is not set for DDMC, set serial number. Without a serial number, the DD VE cannot be added to DDMC as managed-system.

4. Run the following command on DDMC to add managed DD VE system DD VE to DDMC,
   
   ```
   managed-system add <IP address of DDVE> inbound-proxy <IP address of DDMC> outbound-proxy <IP address of DDVE>
   ```
   
   managed-system add 10.98.99.237 inbound-proxy 10.98.99.225
   outbound-proxy 10.98.99.237
   The SHA1 fingerprint for the remote host's CA certificate is 46:3D:3C:B3:38:CE:31:E1:CE:1B:E6:4B:41:42:D3:78:00:D9:01:60
   Do you want to trust this certificate? Are you sure? (yes|no) [no]: yes
   ** Once added, all "admin" role users on this DD Management Center will operate on "10.98.99.237" system with "admin" role. And all "limited-admin" role users on this DD Management Center will operate on "10.98.99.237" system with "user" role if the system version is 5.7 and below, or "limited-admin" role if the system version is 6.0 and above.
   
   To allow "10.98.99.237" to be managed by this DD Management Center, Enter "10.98.99.237" sysadmin password: ok, proceeding. 10.98.99.237 is added. It may take a while to collect all information for
"10.98.99.237".
sysadmin@ddmcset-ddmc-1# managed-system show

<table>
<thead>
<tr>
<th>Host Name</th>
<th>Serial Number</th>
<th>State</th>
<th>Status</th>
<th>DD OS Version</th>
<th>Sync Time</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddmcset-ddve-1.datadomain.com</td>
<td>AUDVTPCKZ1SY5W</td>

<td>Jun 6 2017 12:22</td>
<td>standalone</td>
</tr>
</tbody>
</table>

5. In a supported browser, type http://<IP address of DDMC> to connect to DDMC GUI.

Results
The DDVE system is added under Systems > Inventory.

Manageability in public cloud

This version of DD Management Center allows for cloud manageability, the creation of virtual machines, and manage capacity through Azure and Amazon Web Services (AWS).

Using Amazon Web Services (AWS) Marketplace Amazon Machine Image (AMI)

The Amazon Machine Image (AMI) can be created in one of two ways: one is through the Amazon Web Services portal and the other is through the CLI. To deploy Data Domain Management Center from the AWS Marketplace, perform the following steps.

Before you begin
If you do not already have an Amazon Web Services (AWS) account, contact the AWS administrator.

Account information includes the following:
- Account user ID
- Password

Note
Initial DD Management Center password for deployment in AWS is the instance ID.

- Access key ID
- Secret access key

Procedure
1. Log in to the AWS portal.
2. Select EC2 Service.
3. Select the region.
4. Click Launch Instance.
5. Select AWS Marketplace in the left navigation pane.
6. Search for Data Domain and select DD Management Center.
7. To complete the AMI deployment process, follow the steps in the AWS wizard.
Using the CLI to create Amazon Web Services (AWS) Amazon Machine Image (AMI)

The Amazon Machine Image (AMI) can be created in one of two ways: one is through the Amazon Web Services portal and the other is through the CLI. To create an Amazon Machine Image (AMI) using the CLI, follow these steps.

**Before you begin**

If you do not already have an Amazon Web Services (AWS) account, contact the AWS administrator.

Account information includes the following:

- Account user ID
- Password
- Access key ID
- Secret access key

**Procedure**

1. Download and install the **AWS CLI tool**, which is available for Windows and Linux (http://docs.aws.amazon.com/cli/latest/userguide/installing.html).
2. Verify that the tool is installed by opening a terminal, shell, or command prompt and entering the following command: `aws help`

   The AWS help text should be displayed:

   ```
   Description
   *******
   The AWS Command Line Interface is a unified tool to manage your AWS services.
   Synopsis
   *******
   aws [options] <command> <subcommand> [parameters]
   Use *aws command help* for information on a specific command. Use *aws help topics* to view a list of available help topics. The synopsis for each command shows its parameters and their usage. Optional parameters are shown in square brackets.
   Options
   *******
   "--debug" (boolean)  
   -- More --
   ```
3. Using the command line tool, run `aws configure` and paste in the access key ID and secret key when prompted. Subsequent logins have default values based on the last successful login. The region setting is where the DD Management
Center is uploaded and deployed, and the default output format should be JSON.

4. Download the DD Management Center or VMDK (VM disk image file format) for AWS of choice from Online Support to the same system where AWS CLI is installed.

   **Linux example:**
   ```bash
cp ddmc-aws-0.19.100.0-551712-osdisk.vmdk <your AWS folder>
   ```

5. Upload this VMDK to the appropriate S3 bucket:
   ```bash
   aws s3 cp <downloaded ddmc vmdk name> s3://<your images bucket>/<downloaded ddmc vmdk name>
   aws s3 cp ddmc-aws-0.19.100.0-551712-osdisk.vmdk s3://ddmc-image-bucket/ddmc-aws-0.19.100.0-551712-osdisk.vmdk
   ```

6. Create or edit `containers.json` to use the file name of the VMDK for the "S3Key." This JSON file should be in the same folder as the AWS CLI and have the following contents:

   ```json
   {
       "Description": "DDMC Import",
       "Format": "vmdk",
       "UserBucket": {
           "S3Bucket": "xxxx-xxxx-xxxxx",
           "S3Key": "ddmc-aws-0.19.100.0-551712-osdisk.vmdk"
       }
   }
   ```

   Be sure to replace the S3Key field with the VMDK file name and that you are using the correct S3Bucket name.

7. Create the Amazon Machine Image (AMI) by using the uploaded VMDK and the CLI:

   ```bash
   aws ec2 import-snapshot --description "ddmc import" --disk-containers file://ddmc_import.json
   ```
To check progress of the new task that was just created, note the "ImportTaskId" value from the JSON returned by the above command, and use it in the following command:

```bash
aws ec2 describe-import-snapshot-tasks --import-task-ids import-snap-ffje91fn
```

8. Once it is done, look for the Status Message "completed" and note the snap-ID.

**Deploying DD Management Center with Amazon Web Services (AWS)**

To deploy DD Management Center in Amazon Web Services (AWS), follow these steps.

**Before you begin**

If you do not already have an Amazon Web Services (AWS) account, contact the AWS administrator.

Account information includes the following:

- Account user ID
- Password
- Access key ID
- Secret access key

**Note**

Initial DD Management Center password for deployment in AWS is the instance ID.

1. Open a web browser, and go to https://ddltr.signin.aws.amazon.com/console. Login with user ID and password. Select the appropriate region.

**Note**

If the VMDK was manually converted, the selected region must match the region from the conversion process.

2. Prepare to launch the instance by selecting the Services drop-down on the left side, then choose EC2.

3. From the navigation pane on the left side, select Snapshots under Elastic Block Store.

4. If the CLI was used to create the AMI, locate the snapshot ID.

5. Click Actions > Create Image.

6. In the new dialog box, name and describe the new image. Be sure to select the Hardware-Assisted Virtualization option.

7. Once the image is created, use the AMI ID to locate the image and launch the VM.

8. Click the Add New Volume button, set the Volume Type to EBS and the Size to 200GiB, tick the two boxes for Delete on Termination, then click Next: Add Tags.

9. Add a value for Name (following established naming conventions), then click Next: Configure Security Group.
10. Select a security group that has SSH, HTTPS, and RDP ports open, then click **Review and Launch**.

11. Click the **Launch** button. You may safely ignore the warning about free usage tier eligibility.

12. Type the security key pair. This information is needed when accessing the DD Management Center via SSH. Click **Launch Instances** and then **View Instances** when it starts launching.

13. Locate the instance name from step 12, click it and note its IP address below the list.

**Results**

When the instance has finished booting up, it may be accessed in the VPC and subnet selected earlier.

- Local network policy may block access to these subnets and ports. In this case, an alternate network must be used.
- Initial DD Management Center password for deployment in AWS is the instance ID.
- For command-line access, an SSH client (such as PuTTY) may be used with the key pair from step 12.
- For GUI access, a web browser can be used if it is in the same subnet.
- Cloud-based DD VEs can be now added to the DD Management Center.

**Deploying Data Domain virtual edition systems**

**Introduction**

The DDMC provides new REST APIs to automate managing the lifecycle of Data Domain Virtual Edition (DD VE) systems running in Amazon Web Services (AWS).

The DD VE lifecycle management APIs allow you to integrate cloud-based DD VEs into your cloud operations systems. The APIs allow you to:

- Securely manage AWS credentials
- Deploy DD VE instances
- Provision EBS storage for the Data Domain file system
- Ensure DD VEs are consistently deployed
- Deprovision and destroy DD VEs when they are no longer needed

**Installation and prerequisites**

The DD VE deployment APIs are delivered as part of the DD Management Center. DD MC runs as a virtual machine, separate from the DD VEs and DD Systems it is managing. DD MC can run on on-premises hypervisors (ESX, vCloud, Hyper-V, or KVM) or as a VM in AWS or Azure. See the DDMC installation guide for details.

In order for DDMC to manage cloud DD VEs, it requires an unblocked network access to invoke AWS APIs and the DD VE APIs (port 3009 on the DD VE, accessed via HTTPS).

DD VEs need a license to ingest and restore data. Rather than install individual license files, the DD MC will configure DD VEs will use a license server. You need to install a license server and configure DDMC to learn about the server. You also need to install a served license file on the license server with sufficient capacity for your intended deployment.
Managing Amazon Web Services (AWS) credentials

In order to deploy DD VEs and provision storage, DDMC needs to be able to invoke AWS APIs. AWS requires an API caller to present credentials to authenticate the caller before executing the API.

To prevent security issues, the DDMC has two ways to access AWS credentials. The first, and most secure, method is to run DDMC as an AWS virtual machine. If you configure the DDMC with the AmazonEC2FullAccess, AmazonS3FullAccess, and IAMFullAccess permissions, this will enable DDMC to invoke AWS APIs using a temporary set of credentials.

If you cannot use role-based credentials, you can create an Access Profile. The Access Profile securely stores the AWS public key and secret key in the DDMC database. When a user invokes the DD VE deployment API, DDMC will use the named set of credentials to deploy the DD VE and provision storage. You can create as many Access Profiles as you need using the /rest/v1.0/system/vi/access-info URI. You operate on access profiles using the standard POST, PUT, GET, and DELETE operations.

Preparing the DD VE Amazon machine image

Before you can deploy a DD VE, you have to create an Amazon Machine Image (AMI). The DD VE code is delivered as a VMware virtual disk file (VMDK). Amazon has tools to convert this into an AMI. In brief, you transfer the DD VE boot disk image to a S3 bucket and use the Amazon tools to convert this to an AMI. When done, the AMI will be assigned an AMI ID. You will need this ID as part of the deployment process.

Managing virtual resources

You can deploy many DD VEs using the same set of hardware resources. DDMC enables you to create a collection of resources to be used in every deployment to maintain consistency. This object is called a resource profile. In AWS, the resource profile specifies:

1. The AWS region, e.g. "us_east_1"
2. The name of the AMI to use for deployments
3. The AWS subnet ID
4. The AWS security group

See the AWS documentation for more information about the region, subnet ID, security group, and AMI ID. The AMI ID is the ID you get when you create the DD VE AMI. Resource profiles are managed through the /rest/v1.0/system/vi/resource URI.

Creating a DD VE configuration template

The deployment process applies a configuration template to a newly deployed DD VE. The configuration template defines a set of DD OS settings you would like to be consistently applied to your DD systems. The template is stored in the DDMC database. The configuration template has sections for network settings, alert notification, time settings, DD Boost, and more.

To create a configuration template, you must first deploy a DD system, configure and test it, then extract a template from that system. You create configuration templates using the POST /rest/v1.0/system/config/templates API, passing in a name for the template and the name of a DD System from which to extract the template. Refer to Appendix B.

Deploying a DD VE

After all the preparation steps, you are ready to deploy a DD VE. When deploying a DD VE, DDMC executes a workflow with several steps. The workflow steps are as follows:
1. Creating and booting an AWS virtual machine using the DD VE AMI.
2. Provisioning EBS volumes to hold the DD file system data and attaching those volumes to the DD VE.
3. Configuring the DD VE to use a license server.
4. Setting the DD VE hostname, IP address, and sysadmin password.
5. Creating a DD file system on the EBS volumes.
6. Applying an optional configuration template.
7. Adding the DD VE to the DD MC inventory.

You initiate the process by executing a POST to /rest/v2.0/dd-systems. This is an updated API for this release. The request body includes a new structure which tells DDMC to deploy a DD VE. The request structure looks like this:

```json
POST /rest/v2.0/dd-systems
{
    "hostname": "my-ddve-hostname",
    "password": "abc123",
    "deploy_info": {
        "environment": "aws",
        "common_deploy_info": {
            "vm_name": "my-ddve-name",
            "access_profile_name": "aws_access_profile",
            "resource_profile_name": "resource_profile",
            "config_template": "configuration_template_name"
        },
        "aws_specific_deploy_info": {
            "init_config": 2,
            "max_config": "8TB"
        }
    }
}
```

Refer to the online REST documentation for an explanation of the fields. The AWS and legal values and descriptions are as follows.

**Table 8 AWS, legal values, and descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Legal values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>init_config</td>
<td>Unsigned integer between 1 and max config size</td>
<td>Capacity of DD file system when initially deployed in TiB.</td>
</tr>
<tr>
<td>max_config</td>
<td>&quot;8TB&quot;, &quot;16TB-A&quot; and &quot;16TB-B&quot;</td>
<td>This is the maximum allowable capacity of the DD file system. All DD VEs will be provisioned and licensed with a 500 GiB evaluation license.</td>
</tr>
</tbody>
</table>

This takes several minutes to complete. Make sure that the REST client has a sufficiently long timeout.

While the deployment is running, you can monitor its progress by executing a GET on /rest/v1.0/tasks URI. This will list all (or active) tasks. From the task list you can retrieve a task ID and use that id to GET /rest/v1.0/tasks/{ID} to get the detailed status of the running task.

**Managing a DD VE**

Once the DD VE is deployed, you can monitor and manage it using all the standard DDMC interfaces. You can monitor status, health, capacity and much more through...
the DD MC GUI. You can launch System Manager to make changes to the DD VE. Additionally, there are many DDMC REST APIs you can use to do things like provision mtrees, create NFS exports, build your own performance monitoring applications, and perform delete/deploy functions. Refer to Appendix B.

Destroying a DD VE
When you are done with the DD VE, use the DELETE /rest/v1.0/dd-systems/{SYSTEM-ID} API to remove the DD VE from the DDMC inventory. In addition to removing the system from the inventory, DDMC will destroy the DD VE and deprovision the EBS storage used for the file system. Again, this is a long running task which you can monitor using the /rest/v2.0/tasks URIs. Refer to Appendix B.

DD Management Center in Azure Marketplace

Perform the following steps to deploy Data Domain Management Center from the Azure Marketplace.

Procedure
1. Log into the Azure portal.
2. Select Virtual Machines from the left pane.
3. Click Add.
4. Select DELL EMC Data Domain from the Azure Marketplace.
5. Click Create.
6. Complete the settings information under **Basics**. Click **OK**.
7. Choose Standard_D2 size. If not visible on the page, please click View All. Click Select

8. Under Storage and Network settings, provide details on the storage account, virtual network, subnet, and network security group. Please keep High Availability, Storage (Use managed disks), and Public IP Address as None/No as shown in the example. Keep diagnostics off and only turn them on when required. To keep diagnostics logs, specify the storage account. Click OK.
9. Click Purchase.
10. Wait for VM to successfully deploy. In case of any error, the problematic parameter will be mentioned in the error.

Powering on DD Management Center

If installation is successful, you can power on the DD Management Center virtual machine and log into the system.

Procedure

1. Open the client, and navigate to the location where you configured DD Management Center.
2. Right-click on the instance, and select **Power On**.
3. Optionally, right-click and select **Console** to view the boot and initialization process. After a successful boot sequence completes, a CLI prompt appears. You can log in as **sysadmin** with the initial password **changeme**.

Note

While the CLI can be used to log in to DD Management Center and perform some operations (see “Differences between DD Management Center CLI and DD OS CLI on page 166”), the preferred interface for working with DD Management Center is the GUI.
Logging in and out of DD Management Center

DD Management Center is accessed by using a supported browser on a workstation that has network access to the DDMC instance. DD Management Center supports multiple simultaneous users.

The following browsers are supported for use with DD Management Center:

- On Microsoft Windows – Microsoft Internet Explorer 11 and Edge; Mozilla Firefox 30 and higher; Google Chrome
- On Apple OS X – Mozilla Firefox 30 and higher; Google Chrome

Other browser versions may also work; these particular versions have been validated. See the Data Domain Management Center Release Notes for the most up-to-date information.

Logging into DD Management Center

Initial login requires using the “sysadmin” user ID and the “changeme” password (the default password). You are then prompted to change the sysadmin password. After that, other users with different roles (that have been added to DD Management Center) may login.

To log in to DD Management Center:

Procedure

1. Open a browser, and enter the host name or IP address of DD Management Center.

   A Secure Login link is provided for establishing a secure connection over the network using HTTPS instead of HTTP. This option uses a self-signed certificate by default, which the user must accept, despite browser warnings.

2. In the login window, enter a user name and password, and press Enter, or select Log In.

Results

After you log into DD Management Center, the Dashboard is displayed, showing the default set of monitoring widgets.

Logging in with Public Key Infrastructure (PKI) and Common Access Card (CAC) certificates

Users can login to DD Management Center with their existing PKI/CAC and present the Data Domain system(s) with a certificate for authentication or authorization.

Before you begin

Logging in with a certificate is only available through a secure login page (HTTPS), and it also requires an import of CA Root and intermediate files through the CLI.

Procedure

1. To import CA Root, enter the following command in the Windows or Linux CLI:

   ```
   ssh sysadmin@DDMC adminaccess certificate import ca application login-auth < rootCA.crt
   ```

2. To import the intermediate CA files, enter the following command in the CLI:
ssh sysadmin@DDMC adminaccess certificate import ca application
login-auth < intermediateCA.crt

3. Select the "Log in with certificate" link.

The Select a Certificate dialog displays, allowing users to select the appropriate certificate to use to login to DD Management Center.

**Note**

Only users that exist in DD Management Center will display.

- Certificate supports local, NIS, and AD users.
- Users are authenticated by the Data Domain system using the public certificate present on the CAC/PKI.
- Using a CAC/PKI card might require the user to enter a PIN as part of the certificate authentication process.

---

**Logging out of DD Management Center**

To log out of DD Management Center, select the Log out button (right-pointing arrow at the top right of the banner), or just close your browser window.

**Continuing DD Management Center configuration**

You have just completed basic DD Management Center configuration and are ready to use DD Management Center.

The basic configuration allows DD Management Center to be started, but many more settings may need to be configured to fully integrate DD Management Center into your site.

You may need to configure network settings and routing tables, set the time zone configuration, and provide access for users. All of this information is described in the Performing additional configuration chapter.

**Understanding RBAC in DD Management Center**

DD Management Center uses role-based access control (RBAC) to control how data is manipulated and displayed both within DD Management Center and on Data Domain systems managed by DD Management Center.

DD Management Center users can:

- Have one of three roles within DD Management Center: admin (system administrator), limited-admin, or user (basic user)
- Have one of four roles on the Data Domain systems managed by DD Management Center: admin (system administrator), limited-admin, user (basic user), or backup operator
- Modify DD Management Center states only if they have the admin or limited-admin role
- View data from a Data Domain system (through DD Management Center) as permitted by the role they have on that Data Domain system
• Modify a Data Domain system only if they have the admin or limited-admin role on that Data Domain system

Viewing DDMC page elements

DDMC is composed of a variety of page elements.

Figure 1 DDMC page elements

1. Navigation Panel with Module listing
2. Banner
3. Dashboard Widget
4. Settings
5. Logout Control
6. Online Help Control
7. Work Area
8. Status Bar and Notification Area

Unless the dashboard is maximized, the banner is visible at all times and provides controls to filter the scope of the work area's active page (the filter control is displayed only on monitoring pages), open the online help, and log out.

The navigation panel is organized by module – Dashboard, Health, Capacity, Replication, Reports, Administration, and Inventory. Within each module, you can select the name of a subject page to be displayed in the work area.

The status bar shows the active user name and role, date, and alerts notifications (which you can select, to see an informational pop-up with a link to the Alerts page).
Standard global controls (add, edit, delete) enable interaction with the application and manage how information is displayed on pages with tables (sorting column content by ascending/descending controls, hiding/displaying columns).

Navigating a DDMC page

Navigation elements on a DDMC page change the focus and scope of the content displayed in the work area.

Figure 2 DDMC page navigation

1. Module topics are found on the left, in the navigation panel.
2. Tabs (if applicable) are found at the top right, in the banner.
3. Toggle buttons (if applicable) let you change from a standard Data Domain system list, to a group of systems, to a Tenant view, etc. If you choose groups, only groups that you have created will be displayed. In this picture, you can choose from a Systems or Groups view.

Organizing the dashboard

The Dashboard holds widgets that you create from a set of monitoring functions. The Dashboard lets you quickly check important conditions, such as unreachable systems, active alerts, diminishing capacity, etc.

You can set up separate tabs on the dashboard and include specific widgets for each of those tabs. Suggested uses for tabs are to organize a set of systems based on group membership, location, OS version, data type, etc. Another suggestion is to
organize by widget type, for instance, a tab containing Current Health Status widgets for all systems.

By default, each user is assigned a Dashboard with one tab, populated by one each of the supplied widgets, configured to cover all of the systems that a user is monitoring. You can modify, add to, or even delete this default Dashboard tab.

A tab with all of its widgets can be copied to a new tab and then edited. Up to seven tabs are allowed.

Adding tabs

To customize your DD Management Center setup, you can add tabs – choosing a unique name, number of columns, and placement.

Procedure

1. Select **Home > Dashboard**.
2. On the dashboard, select the **Add tab** control in the banner, at the top right.
3. In the Add and Configure Dashboard Tabs dialog, select Add (green plus sign).
4. In the highlighted text field, enter the name for the tab.
5. Choose the number of columns for the tab (more columns produce smaller widgets).
6. Order the placement of the tab across the dashboard using the **Move Up** or **Move Down** controls.
7. Select **Save**.

Results

The new tab is displayed on the dashboard.

Adding widgets

You can also add widgets to customize your DD Management center setup.

Procedure

1. Select **Home > Dashboard**.
2. On the dashboard, navigate to a tab (All Systems, etc.), or create a new tab (see the preceding section).
3. Select the **Add widget** control in the banner, at the top right.
4. In the Add Dashboard Widget dialog, enter a Name that will reflect the widget's use. For example, using a Lag Thresholds template, you could name the widget “New Jersey Lag Thresholds” if you have set filters to show only those systems that replicate to New Jersey. The name must be unique for this tab.
5. Select a Template for the desired output. When you select a template, an image appears under Example, showing an example of a widget of that type.
6. If applicable, in the Settings area, select any of the available options (such as filtering to narrow the scope of the widget monitoring). Widgets can be filtered using standard filter primitives such as systems, groups, and properties. Also, depending on the template, you may have other settings that you can configure.
7. Select **Add**.

Results

The new widget is displayed on the dashboard.
Widget templates

You can add, edit, or delete widgets from the dashboard, by selecting the Add widget control in the banner at the top right, by using the Edit widget control in the banner of each widget, or by using the Remove widget control in the banner of each widget, respectively.

**Health Status widget**

The Health Status widget shows a summary of important health factors for monitored Data Domain systems, such as the status of the file system, replication status, alerts, and protocol status.

If all the systems are healthy, a green version of the widget will be shown, filling the arc pattern. However, if some of the systems are unhealthy - either in File System, Replication or other areas, a ratio will be shown in the Red Graph, and the number below will display the count. Navigation from this widget takes the user to the Health Status page.

Select the Show detail control (>>) to display the Health > Status page.

**Note**

Unmanaged systems are shown in the Unreachable Systems list and their health is not summarized in the Health Status widget.

**Active Alerts widget**

The Active Alerts widget shows the distribution of active alerts across all managed systems by type – Emergency & Alert, Critical & Error, and Warning.

If there are no alerts on any of the systems in the inventory, the widget will show an empty arc, and the text color will change to neutral blue. Warning level alerts are shown in yellow, and critical and above are shown in red. If there is at least one alert, the arc will be full; it functions similar to a pie chart. Navigation from this widget takes the user to the Health Alerts page.

Select the Show detail control (>>) to display the Health > Alerts page, where a complete list of Health Alerts is displayed.

**Capacity Thresholds widget**

The Capacity Thresholds widget shows the distribution of capacity usage across all managed systems.

This widget shows the count of systems which have crossed capacity thresholds. If none of the systems have crossed a threshold, the widget will show an empty arc. Systems which have crossed the warning threshold are shown in yellow, and systems which have crossed the critical threshold are shown in red. Navigation from this widget will take the user to the Capacity Utilization page.

Select the Show detail control (>>) to display the Capacity > Utilization page.

**Capacity Used widget**

The Capacity Used widget shows ratio of space used to available space.

This widget shows the total percentage of capacity used. Since the widget doesn't represent a Health state, the text and color will always be a neutral state. The gauge will show blue to the ratio of the used capacity, and the text will always be blue. Navigation from this widget will take the user to the Capacity Utilization page.

Select the Show detail control (>>) to display the Capacity > Utilization page.
Replication Status widget

The Replication Status widget shows a summary for replication pairs and cascaded pairs.

This widget shows a count of systems which have replication issues. If there are no replication-related issues, the widget shows an empty arc. If there are systems with problems, then the widget shows the ratio of the issues. Navigation from this widget takes the user to either the Automatic or On-Demand Replication pages, depending on which type the widget was configured for.

Configuration options include setting the widget to monitor only Automatic or only On-Demand replications.

Select the Show detail control (>>) shows the Replication > Automatic page.

Lag Thresholds widget

The Lag Thresholds widget shows the count of replications with critical and warning levels, based on the Lag Threshold Policy.

This widget shows the count of pairs which have crossed lag thresholds. If none of the pairs have crossed the threshold, the widget shows an empty arc. Pairs which have crossed the warning threshold are shown in yellow, and pairs which have crossed the critical threshold are shown in red. If both warning and critical thresholds had been crossed for a replication pair, then the worst status (critical) takes precedence. Navigation from this widget takes the user to Replication > Automatic page.

Select the Show detail control (>>) to display the Replication > Automatic page, where the list of all filtered replications is shown. The Lag Threshold Policy can be viewed or changed from here.

High Availability Readiness widget

The High Availability Readiness widget shows a status summary for all the HA systems in the inventory.

This widget shows the total number of HA systems, the number of HA systems that are Not Ready For Failover, and the number of HA systems that are Ready for Failover. If there are any HA systems that are Not Ready For Failover, the gauge shows that fraction colored red. If all HA systems are Ready for Failover, the gauge shows all green.

Users can filter by systems, groups, properties and rules. Filtering by systems shows only the HA systems available in the inventory.

Selecting the Show detail control (>>) takes you to the Health > Status page. If there are HA systems in the inventory, this navigation will show systems filtered by HA systems.

Clicking on the gauge also navigates to the Health Status Page, filtered by any HA systems that are Not Ready For Failover. If all systems are Ready for Failover, navigating to the Health Status Page from the graphic shows a list of HA systems.

Cloud Health widget

The Cloud Health widget monitors the health from a cloud-enabled system's perspective.

A new Cloud Health option is available in the Add Dashboard Widget dialog box Template option dropdown. Selecting the Cloud Health option shows the preview image for the Cloud Health widget. This widget shows the Cloud Tier health of Cloud
extended systems in the inventory. Filters can be applied to the Cloud Health widget, similar to all the other Dashboard Widgets. Filter by System option for Cloud Health widget only shows a list of Cloud extended systems.

Monitoring Cloud Unit Health is done at the system level in DD Management Center. Therefore, the Health Status view indicates the number of cloud enabled systems that are Active (green), Delete Pending and Disabled (yellow), and Error and Disconnected (red).

**Note**

The Data Domain system must be running DD OS 6.0 and have Data Domain Cloud Tier (DD Cloud Tier) licensing enabled. Any system running older software will not display DD Cloud Tier information on reporting pages, widgets, or reports.

When the Cloud Tier of each of the Cloud extended systems that are registered with a DD Management Center is healthy, meaning the Cloud units on those systems are healthy, the Gauge is displayed in a Green color.

Clicking the Gauge (or the image within the widget or the Show Details (>>) button on the toolbar) navigates to the Health Status page, which is filtered by the complete list of the Cloud extended systems.

If a system has two cloud units, one in the Delete Pending and Disabled state and the other in the Disconnected state, the widget shows yellow.

When the Cloud Tier on some or all of the Cloud extended systems is not healthy, meaning one or more Cloud units on those systems are not healthy, the Gauge shows the fraction of the Cloud extended systems whose Cloud Tier is not healthy. If all five Cloud extended systems are Unhealthy, then the complete gauge is Red.

Clicking the Gauge (or the image within the widget or the Show Details (>>) button on the toolbar) navigates to the Health Status Page filtered by the Cloud Extended Systems that are Unhealthy.

If one Cloud Unit is healthy and one has errors, the widget should display **error** for the DD Cloud Tier and requires further troubleshooting to determine the source of the error and any remedial action that can be taken. The widget displays a gauge with the error proportion colored red and the remaining gray.

**Note**

The worst state for the Cloud Units in a system takes precedence.

Users can filter by systems, groups, properties, and rules. Filtering by systems shows only the Cloud Extended systems available in the inventory.

**Copying tabs**

You can create a new tab that contains the same widgets as an existing tab by copying that tab.

**Procedure**

1. Select **Home > Dashboard**.
2. Select the **Add tab** control in the banner, at the top right.
3. In the Add and Configure Dashboard Tabs dialog, select the name of the tab to copy and then **Copy**.
4. In the text box, enter the new name for the tab (typing over “Copy of ...”).
5. If you want to change the number of columns, select the current number, and change it using the drop-down list.
6. If you want to change the placement of the new tab, use the Move Up or Move Down arrows.

7. Select Save.

Results
The new tab is displayed on the dashboard. You can open the widgets on the new tab to modify their properties.

Modifying widgets
You can modify widgets that were copied from a tab as a starting point for a new set; for example, you could change the filter properties to monitor a different group, set of systems, or rule.

To modify a widget, use the Edit widget icon on the widget's title bar, and change the name, settings (if available), and filtering.

Note
You cannot change the widget type (as determined by the widget template) with the Edit function.

Organizing managed Data Domain systems
As you organize and categorize each system, be aware that:

- Groups can be applied only to Data Domain systems.
- Properties can be applied to Data Domain systems, MTrees, and replication contexts.
- A default set of system properties (Data Domain system model, DD OS version, and domain name) is automatically assigned when a system is added. Custom properties can be set. Data center properties can also be modified but not deleted.

After you have completed the initial setup for each Data Domain system, you can assign values to properties or place a system in a group by selecting a system and clicking Edit.

Creating groups
Groups are ways to organize Data Domain systems under a specific name, in a hierarchical structure created by the DD Management Center administrator.

Groups are helpful for performing searches. When used with filters, groups reduce the number of systems returned. Groups can contain other groups and/or Data Domain systems. A group can belong to only one group, but a Data Domain system can belong to many groups. You start by creating one or more super-groups at the Groups level, and then add sub-groups and Data Domain systems.

Note
Data Domain systems cannot be added at the root Groups node. Group hierarchy structures cannot be changed; they must be deleted and re-created to change the structure.

Procedure
1. Select Administration > Groups.
2. To add a group at the root level, select Add (green plus sign).

3. Make sure only the “/” is in the Path box. Enter a name for the new group, and select Save.

   The new group is now listed in the Groups panel.

4. To add a sub-group to a group, select a group (which will be the parent group) from the Groups panel, select Add (green plus sign), enter a name for the sub-group, and select Save.

   The sub-group is nested under the parent group in the Groups panel.

5. After a Data Domain system has been added to DD Management Center, it can be added to a group. Select the target group from the Groups panel, and select Add (green plus sign). In the Add Group dialog, select a Data Domain system from the Available Systems panel, select > to move the system into the Systems in the Group panel, and select Save.

   The Data Domain system is displayed in the Group Details panel when the group is selected in the Groups panel. When a Data Domain system resides in more than one group, you can hover the cursor on the Information control to display the group assignments.

Adding properties to systems and replication pairs

Properties provide information for classifying systems, and the data contained in Replication contexts, for searching, filtering, and organizing. For example, you could assign properties to help filter the list of Data Domain systems in the Inventory > Systems page and narrow the scope of output that is produced by a dashboard widget or generated report. When a Data Domain system is added to DD Management Center, a set of default administration properties (Data Domain system model, DD OS version, domain name, and data center) is automatically added. You can add and assign other properties as needed.

Procedure

1. Select Administration > Properties.

2. At top right, select one of the tabs (System or Replication), and select Add (green plus sign).

3. In the Add Property dialog box, type a name for the property, and select its operation type:
   - **String** – Allows a string of up to 256 characters to be set when assigning the property, for example, you could name the property “Comments”, and a user could enter “Waiting for Tom's response”, “Not ready yet”, etc.
   - **Boolean** – Creates a condition where you can assign one of two values, for example, you could name the property “Restored?”, and possible values could be “True” or “False”, or “Yes” or “No”.
   - **Fixed-value String** – Lets you provide a name and specific values for the property, for example, “Department” could be the name, and “Finance”, “Human Resources”, “Marketing”, etc., could be the values. Selecting the option **Allow multiple types** lets you assign more than one value.

4. Select Add.

5. Assign values to the properties, as described in “Assigning Properties”.

...
Adding (registering) Data Domain systems to DD Management Center

Before you can manage a Data Domain system in DD Management Center, you must add (register) it to the inventory. A single DD Management Center instance can have a maximum of 150 Data Domain systems added. Groups of up to 20 systems can be registered at one time.

Procedure

1. Select Inventory > Systems.

2. Select Add (green plus sign). Type the following for the first Data Domain system, then select Add to continue adding systems (up to 20 systems total). Ensure the box next to the system being added is checked.

   - Select Data Domain System or Data Domain HA system.
   - Host name (required) – Type the fully qualified hostname (use alphanumeric characters, dashes, periods, and underscores) or IP address. Ensure that the hostname and the DNS name for the Data Domain system match; a mismatch may cause problems with backup software.
   - Sysadmin password (required) – Type the sysadmin password that is used on the Data Domain system (required).
   - Proxy Firewalls (optional) – Type the inbound and outbound proxy hostname (or IP address) and port number to be used by the firewall. If this option is selected, and you do not change the port number, the default (3009) is used. If you do change it, the port number must be between 1 and 65535. The default port settings let DD Management Center communicate with the Data Domain system. If the ports have been changed on the firewall or the Data Domain system, they should also be updated here.

   **Note**

   For HA systems, specify the floating hostname, otherwise the Add operation fails.

   - Certificate (optional) – Check certificate information by clicking in the associated cells. The Subject name in the DD Management Center CA certificate should match the DD Management Center hostname, or SSL fails the host verification.

   **Note**

   For environments that use self-signed SHA-256 certificates, the certificates must be regenerated manually after the upgrade process is complete, a trust must be reestablished with external systems that connect to the Data Domain system.

   - Progress – Shows the percentage that is completed as the system is being added.
• **Takeover managed system** – Select this checkbox if the Data Domain system is managed by another DD Management Center. The Data Domain system becomes unmanaged but not removed from the other DD Management Center.

3. Select **Register** to continue.

**Results**

A progress bar appears on the page showing the progress of the initial data synchronization for the newly added Data Domain system(s). Additionally, job progress details can be tracked on the **Health > Jobs** page.

---

**Note**

In case of failure, select **Get failure reason** on the progress bar. After correcting the failure reason issue, click to re-register again.

---

After a Data Domain system is added to DD Management Center, all historical information for that Data Domain system is copied to DD Management Center. From that point on, whenever operational data changes on that Data Domain system, the Data Domain system notifies DD Management Center, which immediately polls the Data Domain system to receive that new information.

**Common Causes of Errors While Adding Systems**
The following checklist may help you resolve some errors that can occur when trying to add a Data Domain system to DD Management Center:

- Ensure the Data Domain system is online. A Data Domain system **must be online** to be added to DD Management Center.
- If you specified a port number in the proxy firewall settings, ensure it is correct.
- Ensure there are no networking issues preventing communication between the DD Management Center and the Data Domain system.
- If you specified a hostname for the Data Domain system, ensure the hostname can be resolved in the namespace (DNS or host list).
- Ensure the password that is entered for the system is correct.
- Ensure the DD OS version of the Data Domain system is supported by the current version of DD Management Center (see the Version Support Matrix in the **Data Domain Management Center Release Notes**).
- Ensure the Data Domain system is not already managed by another DD Management Center. To resolve this issue, you can either delete the system from the original DD Management Center or select the **Takeover managed system** checkbox. The system will be added to the new DD Management Center, but the system’s status will be changed to **unmanaged** on the original DD Management Center, and data collection will be suspended for that system.
- For HA systems, ensure:
  - The specified hostname was not the hostname of the standby node.
  - The HA system is not in degraded mode.
  - Both of the nodes are up.
Inbound and outbound proxy host names and port numbers used by the firewall

The inbound and outbound proxy host names (or IP addresses) and port numbers for a firewall must be set if the connection between DD Management Center and the Data Domain system is through a proxy.

Note

This section is disabled when adding HA systems.

Note

In DD Management Center, ports 8009 and 8080 are restricted to localhost only and are inaccessible from outside. DD Management Center is accessed by default HTTP port 80 or, if SSL is enabled, by default HTTPS port 443.

The terms \textit{inbound} and \textit{outbound} are from the perspective of DD Management Center. \textit{Inbound} means from the Data Domain system to DD Management Center, and \textit{outbound} means from DD Management Center to the Data Domain system.

Starting with the simplest situation (direct connection) for explanation, here are some scenarios and how you would set up the inbound and outbound proxy firewall host names (or IP addresses) and port numbers.

DD Management Center connecting directly to a Data Domain system (simple case)

In the simplest case of connecting DD Management Center to a Data Domain system, the Data Domain system can resolve "ddmc.myco.com" to 1.1.1.1, and DD Management Center can resolve "ddr.myco.com" to 1.1.1.2.

Figure 3 Simple case: DD Management Center connecting directly to a Data Domain system

In this simplest case, it is assumed that:

- DD Management Center is able to connect to the Data Domain system using TCP.
- The Data Domain system is similarly able to connect to DD Management Center using TCP.
- DD Management Center, by default, tries to translate the host name of a Data Domain system (that is, the name that is returned using \texttt{net show hostname} or the name that you see in the Data Domain System Manager) to an IP address using DNS or a host file.
- The DD system similarly tries to translate the DD Management Center host name to an IP address using DNS or a host file.
- DD Management Center connects to TCP port 3009 on the Data Domain system, and the Data Domain system connects to TCP port 3009 on DD Management Center.
Data Domain system with multiple network interfaces
When a Data Domain system has *multiple network interfaces*, you need control of the specific interface used by DD Management Center.

*Figure 4 Data Domain system with multiple network interfaces*

In this case, the Data Domain system host name probably does *not* translate to the IP address of the desired network interface. To direct DD Management Center to the desired interface, you must set the outbound proxy host name (or IP address) to a DNS name or the IP address of the desired interface. It is not necessary to set the inbound proxy host name or port number.

NAT firewall between DD Management Center and Data Domain system
When a NAT (network address translation) firewall exists between DD Management Center and a Data Domain system, the firewall is configured so that when you connect to a port on the firewall, the firewall proxies that connection to an IP address and port number on the destination system. The IP address to which DD Management Center connects does not match any IP address on the Data Domain system itself. Port numbers may be re-mapped as well. Therefore, to connect to a Data Domain system, you would connect to a port other than 3009 on the proxy.

*Figure 5 NAT firewall between DD Management Center and Data Domain system*

In this case, when DD Management Center wants to connect to port 3009 on the Data Domain system, DD Management Center must actually try to connect to port 12,345 on the firewall. Conversely, when the Data Domain system wants to connect to port 3009 on DD Management Center, the Data Domain system must actually try to connect to port 54,321 on the other side of the firewall.

To configure this, set the outbound proxy host name to 1.1.1.2 and the outbound proxy port number to 12,345. Set the inbound proxy host name to 1.1.2.3 and the inbound proxy port number to 54,321. The rule is that the outbound host name and port number are the addresses to which DD Management Center should try to connect when it wants a connection to port 3009 on the Data Domain system. The inbound proxy host name and port number are the addresses to which the Data Domain system should connect when it wants a connection to port 3009 on DD Management Center.
Avoiding the addition of host names to peer's DNS server or /etc/hosts file

There may be situations in which you do not want to add the host name of the DD Management Center, or the host name of the Data Domain system, or both, to their peer's DNS server(s) or to their peer's /etc/hosts file.

In these situations, depending on the host name(s) you do not want to add, you can instead specify the IP address of DD Management Center in the inbound proxy host name field and/or the IP address of the Data Domain system in the outbound proxy host name field.

Editing Data Domain system settings

After Data Domain systems have been added to DD Management Center, you can edit their configuration settings, properties, group assignments, and thresholds.

Procedure

1. Select Inventory > Systems.
2. Select one or more Data Domain systems and then Edit (yellow pencil).
3. In the Edit System(s) dialog, choose any or all of the tabs to make changes (select Apply, or change tabs to save the new settings and continue reconfiguration). If you selected more than one Data Domain system, only the Properties and Thresholds tabs are available.

- **Configuration** lets you edit the inbound and outbound proxy host name (or IP address) and port number to be used by the firewall. If this option is selected, and you do not change the port number, the default (3009) is used. If you do change it, the port number must be between 1 and 65535. The default port settings let DD Management Center communicate with the Data Domain system. If the ports have been changed on the firewall or the Data Domain system, they should also be updated here.

  __Note__

  **Configuration** is not displayed for HA systems.

  __Note__

  For more detailed information, see the previous section, Inbound and outbound proxy host names and port numbers used by the firewall on page 49.

- **Properties** lets you edit information for classifying systems, and the data contained in MTrees and Replication contexts, for searching, filtering, and organizing. If you selected more than one system, and there are different values for that property on the different systems, the field will show *Mixed values*. If you change the value, all systems will receive the new value. There are default and user-created (Administration > Properties > System) properties. The default properties of Model, OS, and Domain Name are not editable. Data Center is a “hybrid” fixed-value string-type property. Because it is a default system property, it cannot be deleted, but its values can be edited and set for a Data Domain system.

- **Groups** let you organize Data Domain systems under a specific name, in a hierarchical structure created by the DD Management Center administrator, which is helpful for searches. You can add or remove group assignments, and select or deselect group assignments for the system. Any number of groups and subgroups can be selected.
• **Thresholds** indicate the warning and critical capacity thresholds for Data Domain systems and are shown on capacity views and in reports. Use the slider to specify thresholds as a percentage of total capacity. When editing multiple systems with mixed warning thresholds, the initial warning value is zero. When editing multiple systems with mixed critical thresholds, the initial critical value is 100. If you change the value, all systems will receive the new value.

4. Select OK to save and exit system reconfiguration.

### Assigning properties

The procedure to assign a property varies, depending on where the property is used: Data Domain systems or replication.

#### Assigning system property values

After you add a property to a Data Domain system (Administration > Properties > System), you can assign values to that property.

**Procedure**

1. Select Inventory > Systems.
2. Select one or more systems.
3. Select Edit (yellow pencil), and in the Edit System dialog box, select the Properties tab.
   - Data Center is the default property that should appear when adding a system.
4. For each property listed, assign a value. If you selected more than one system, and the systems have different values for that property, the field shows **Mixed values**. If you change the value, all systems receive the new value. An Undo control is provided for undoing the setting, and a More Details control shows the saved values for each selected system. For properties that were created as a:
   - String – Type the text that will be displayed as the value.
   - Boolean – Select one of the two values from the drop-down list.
   - Fixed-value string (and multi-value) – Select the value from the drop-down list.
5. Select OK to set the values.

#### Assigning replication property values

After you add a replication pairs property (Administration > Properties > Replication), you can assign values to that property.

**Procedure**

1. Select Replication > Overview or Replication > Automatic.
2. Select a replication pair.
3. Select Assign Properties and set a value. For properties that were created as a:
   - string – Enter the text that will be displayed as the value.
   - boolean – Select one of the two values from the drop-down list.
• fixed value string (and multi-value) – Select the value from the drop-down list.

4. Select Assign to set the values.

5. To see values assigned to replication contexts, you can add this property as a column in the replication table on the Automatic replications page:
   a. Select the Show Columns icon.
   b. Select the checkbox of the property from the list.
   c. You will see the name of the property as the column title, and any value assigned to a context will appear in the cell.

Displaying property information

Assigned property values can be displayed either by selecting an element (such as a Data Domain system) and displaying all of the properties assigned to it, or by selecting a property and displaying all of the elements to which it is assigned.

Displaying properties for an element

How you display properties for an element depends on the type of element: Data Domain systems or replication pairs.

Procedure

- **Systems** – Select **Inventory > Systems**, and select a Data Domain system. All properties assigned to that system are displayed in the Properties panel.

  **Note**

  You can also display properties by selecting the “gear” control in the systems banner. When you select one or more properties from the list of configured properties, a column for that property is added to the table. To hide the property, uncheck the property from the list. Some properties may not be removed from the table, so they will not appear in the list of configured properties under the gear control.

- **Replication** – Select **Replication > Overview**, select a replication pair, and select **Pair Details**.

  Any properties assigned to the replication pair are displayed in the Properties panel.

Finding elements by property value

You can also find elements by looking at all of the assigned property values.

Procedure

1. Select **Administration > Properties**, and select the property type (**System** or **Replication**).

   The table shows all of the properties that have been created. Selecting a property displays its assigned values in the panel at the right.

2. To display where the property is assigned, select a property, and select the icon on the right side of the Key column.
In the Property Assignment dialog, you can see the property type, the element where it is assigned, and the property values.

Managing groups

Although group creation and modification can be performed only by the DD Management Center system administrator, any user can apply group designations to their Data Domain systems and can see the complete group structure, although role-based access control (RBAC) permissions control the systems that are displayed for each user.

Any permissions that are applied to a group affect all Data Domain systems in that group. A lock image is added to the groups folder icon when permissions are directly applied to that group.

Use the Administration > Groups page to perform group management:

- Use Add to create groups or to add Data Domain systems to existing groups.
- Use Delete to remove Data Domain systems from the group-level organization. (You cannot use delete to remove systems from a group. But you can edit the group, and remove systems by selecting them in the right panel and selecting the left-pointing arrow)
- Use Edit on a selected group to modify the presence of Data Domain systems within that group or the name of the group.

Note

Groups cannot be dragged and dropped into a different location; they must be changed with the Edit function.

Managing replication lag threshold policies

Replication lag threshold policies warn you when replication pairs do not complete replication within a set amount of time.

By assigning a replication lag threshold policy, you are assured that notifications will be displayed in the Replication > Automatic page and the Replication Lag Status widget when the replication has not completed within the time periods you have set for Warning and Critical levels.

The default policy level for Warning is 24 hours, and the default for Critical is 48 hours.

Replication lag threshold policies can be created only for MTree, collection, and directory replication. Lag threshold policies for On-Demand replications are not supported.

Procedure

1. Select Replication > Automatic.
2. Select one or more replication pairs from the table.
3. To create a policy, select Lag Threshold Policy (or right-click the pair, and select the option).
   a. In the Lag Threshold Policy dialog, from the Threshold policy menu, select Create a new policy.
   b. In the Manage Lag Threshold Policies dialog, select Add.
c. In the text box, enter the policy name, and use the slider controls to set the threshold points for the Warning and Critical lag levels.

d. Select Save.

4. Back in the Lag Threshold Policy dialog, select a policy from the Threshold Policy menu, and select Assign.

Results
The policy is applied to the selected replication(s). The assigned policy name is displayed in the table in the Threshold Policy column.
To modify or destroy a policy, select Manage Lag Threshold Policies (or right-click the pair and select the option). In the Manage Lag Threshold Policies dialog, select a policy from the list, and select Edit or Delete. If a deleted policy was assigned anywhere, it is replaced with the Default policy. Select Save to exit.

Note
The Default policy cannot be renamed or deleted, but it can be modified.

Working with filters
Filters are used to selectively define the output of a DD Management Center function. For example, filters can be used to define the scope of elements that display on a page, tailor the output of a report, or target the Data Domain systems to be monitored for Dashboard widgets. The Filter (funnel-shaped) control appears on pages and dialogs whenever a filter can be used.

The drop-down menu on the Filter control allows you to select the groups, properties, Data Domain systems, or rules to be used for filtering. When a filter is active on a page, the Filter control is highlighted in yellow. Filtering can be switched on or off using the Filter control as a toggle.

The Filter by rule option lets you create custom rules that can be saved for reuse or run in the current location. The rule can be built using any of the standard filter criteria (groups, properties, Data Domain systems), along with any existing properties or groups that have been created. Controls for logic (is, is not, contains, does not contain, etc.) are provided, and statements can be inclusive or selective.

Note
Global Filter is not supported in the Cloud tab.

To create a custom filter rule:

Procedure

1. From the Filter drop-down menu, select Filter by rule.
2. In the Filter by Rule dialog, provide a name for the filter.
3. Using the selection menus in the Match the following area, create the criteria for your rule. The criteria consists of one or more statements.

Create the first statement by selecting an object from the first menu (System, Group, Model, OS, Domain Name, etc.) and a logic condition (contains, does not contain, is, is not, etc.), then the target (text you input or a menu selection, based on the previous selections). For example, a statement could be “Model is DD880”.
4. If needed, add more statements with the Add row (+) control, or add conditions to the rule using the Block (...) control, which adds the choice of All or Any to the Match the following area), and create additional statements.

5. Select the Save (disk) control to make this filter available from the Filter menu list or select Filter to run the filter once and exit.

6. To remove the filter and return to unfiltered content, select Clear filter from the Filter menu.

   Note that the filter may still be available with the Recent filters option on the Filter control list.
CHAPTER 4

Monitoring Data Domain Systems

- Monitoring replication .............................................................................................................................. 73
- Monitoring status with reports ................................................................................................................ 77
How DD Management Center helps you monitor Data Domain systems

The monitoring tools of DD Management Center let you examine a wide array of operational information about managed Data Domain systems.

After a Data Domain system is added to DD Management Center, all historical information for that system is copied to DD Management Center.

When operational data changes on a Data Domain system, the Data Domain system notifies DD Management Center, which immediately polls the Data Domain system to get the latest operational data.

DD Management Center monitoring tools draw on this data for current and historical reporting and for creating trend projections.

DD Management Center monitoring tools are highly visual – using charts, graphs, and color coding to help you interpret essential data points and easily notice alerts for critical markers.

DD Management Center monitoring tools help you focus on areas of interest. They can show mile-high status checks of all managed Data Domain systems and check a specific group of Data Domain systems, as well as drill-down to check the health or operational history of a single system’s components. For capacity monitoring, you can easily check current operation and historical data and perform capacity predictions based on usage trends.

Using the filtering and grouping options provided on monitoring pages, DD Management Center lets you easily shape your data presentation so you can focus on viewing just the information you need.

In addition to data provided on the interface, you can generate reports to compile operational data that can be exported. Reports can be generated ad hoc or scheduled and emailed to a list of interested parties.

Data retention policy for DD Management Center

DD Management Center maintains up to ten years of performance and capacity measurements for the Data Domain systems it is monitoring. Data from the Data Domain systems are consolidated into hourly sample points, generally collected at 30 minutes past the hour. The hourly samples are consolidated into daily samples, where a day is considered to run from Noon to Noon. Daily samples are further consolidated into weekly samples, where a week begins on Sunday.

To reduce the amount of space needed to store this historical data, DD Management Center periodically discards older samples. The number of samples retained depends on the nature of the data and whether the sample is hourly, daily, or weekly data. The following table shows the length of time that DD Management Center retains each sample.

Table 9 Data retention policy for DD Management Center

<table>
<thead>
<tr>
<th>type of data</th>
<th>keep hourly samples for</th>
<th>keep daily samples for</th>
<th>keep weekly samples for</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collection space usage</td>
<td>3 months</td>
<td>1 year</td>
<td>10 years</td>
</tr>
</tbody>
</table>
Table 9 Data retention policy for DD Management Center (continued)

<table>
<thead>
<tr>
<th>type of data</th>
<th>keep hourly samples for</th>
<th>keep daily samples for</th>
<th>keep weekly samples for</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTree space used</td>
<td>1 month</td>
<td>3 months</td>
<td>10 years</td>
</tr>
<tr>
<td>Automatic replication (bytes transferred and lag)</td>

</tbody>
</table>

Finally, DD Management Center retains up to 2,000 historical alerts from each Data Domain system being monitored.

Space projection algorithm for DD Management Center

DD Management Center uses a sophisticated algorithm to project growth in space usage and to predict when a Data Domain system will run out of space. This algorithm was developed and verified using years of autosupport reports and should be quite accurate.

For this algorithm, DD Management Center uses a seven-day moving average instead of actual measured values. This smooths out the effects of file system cleaning and other activities that repeat every week (for example, deleting an old full backup and creating a new one every weekend).

The goal of this algorithm is to compute a linear projection of space growth using an optimal set of recent data points. The data history is scanned to find the projection with the best fit, that is, the regression with the highest $R^2$ value.

The $R^2$ value is a measure of how close the regression fits the actual measurements. A value of 1 means the fit was perfect. A value of 0 means there was no fit at all. A value of 0.8 means that DD Management Center found a projection that matches the measurements closely enough to be meaningful and not misleading.

After the best fit is determined, the projection must pass the following validation tests to ensure that the prediction is accurate:

1. DD Management Center must have at least 15 days of historical data.
2. The regression $R^2$ value must be at least 0.8 or higher.
3. The slope of the regression must be positive (that is, space usage is growing, not shrinking).
4. Time-to-full must be less than 10 years in the future.
5. The Data Domain system must be at least 10% full.
6. The most recent data sample must be within 5% of the projection.

Combining all of these validation criteria accounts for typical Data Domain system usage behavior, such as space becoming free after a cleaning cycle, jumps in usage as new backup loads are stored on the Data Domain system, and space becoming free when backups are deleted.
Performing daily monitoring

Using DD Management Center to perform daily monitoring of your site lets you check for unusual activity before it becomes a serious problem.

You should perform the following tasks at least daily to get an overview of the operational status of your Data Domain systems and data replication.

Checking dashboard status widgets

The Home > Dashboard widgets (Health Status, Active Alerts, Capacity Thresholds, Capacity Used, Replication Status, Lag Thresholds, High Availability Readiness, and Cloud Health) provide an overview of key performance indicators for your monitored Data Domain systems.

You can set up from one to seven tabs to hold any combination of these widgets. By default, one tab is provided named All Systems that is populated with one of each type of widget.

The graphs, dials, and color-coded alerts make it easy to spot system operational problems. Many components on the widgets provide a link to a full-featured page for the function so you can drill-down to see complete information.

If any of its monitored systems are not reachable (because they are Offline, Not Responding, Unsupported OS version, Not Transmitting or Unmanaged), a Status button appears at the top right corner of a widget (except for Active Alerts). Selecting this button shows the count of systems with connection issues. Selecting the Show Health Status link opens the Health > Status page, where a list of these systems is displayed.

Widget templates for commonly used monitoring functions can be used to create widgets for all managed systems or filtered by a set of criteria such as groups, properties, systems, or rules.

After they have been created, you can drag widgets around the dashboard to improve their organization. A widget or a tab with several widgets can be copied and modified to create additional widgets.

The size of the dashboard can be toggled between full screen and normal view.

Checking system capacity

The system capacity widgets help you to spot shortfalls in overall managed storage capacity and monitor managed system storage usage.

Capacity Thresholds

The Capacity Thresholds widget displays systems that have crossed warning or critical storage capacity levels.

Capacity Used

The Capacity Used widget lets you monitor aggregate totals of storage levels for all of the Data Domain systems it is configured to manage. This widget monitors the total storage capacity of all systems (for space that is used and available) or a selected group if a filter is set.
Checking replication progress

The replication widgets provide replication status and issues.

**Replication Status**
The Replication Status widget highlights replications with performance problems for the widget’s monitored systems.

**Lag Thresholds**
The Lag Thresholds widget identifies replication pairs which are not replicating data to the destination fast enough and shows the count of replication pairs which have crossed the Critical, Warning, and Normal threshold levels, based on the assigned policies. This widget identifies these pairs, the duration of the lag time and whether it is improving.

Checking health and alerts

The Dashboard health status and alerts widgets highlight systems that are reporting major reachability or operational problems. And if there are problems, the widgets provide drill-down links to system details.

**Health Status**
The Health Status widget highlights unreachable systems and systems experiencing issues with file system and replication operations, alerts, and data transmission protocols. The widgets show All Normal (green) or show a count of systems exhibiting issues.

Clicking on the gauge navigates to the Health Status page, filtered by the systems in Not Healthy status, if any.

**Active Alerts**
The Active Alerts widget displays a tally of systems with outstanding alerts for Emergency & Alert, Critical & Error, and Warning, using a colored gauge and a rolled up count of Alerts for each system. The worst status takes precedence.

Clicking on the gauge takes you to the Alerts page, filtered by the widget’s configured filters.

Checking alert notifications

For new, unacknowledged alerts on systems you are authorized to manage, always check the “Notification Area,” located in the lower left of the Status Bar (the bottom border of the DD Management Center window).

This Notification Area is not constrained by filter settings that are active, that is, it displays notifications of alerts for all of the systems you are authorized to manage.

The “New Alerts” area shows the current unacknowledged Emergency, Error, and Warning level alerts. Click anywhere in the New Alerts area to display a pop-up reporting the severity, system name, and class of the new alert. After the pop-up has been displayed, the alerts notification is removed from the Alerts Notification area.

To see the alert details, select the “Show me these alerts” link to open the Health > Alerts page, where the table is filtered to show only the new alerts.
Checking health status

The **Health > Status** page displays information about potential operational problems, such as connection status, replication status, and alerts.

The Systems/Groups/Tenants icons at the top right let you show all Data Domain systems, or Data Domain systems organized by group or Tenant assignment.

---

**Note**

Secure Multi-tenancy functionality requires Data Domain systems running DD OS 5.5 or later.

LED colors indicate:

- Red – error or problem
- Yellow – error or warning
- Green – normal operation
- Gray – disabled components
- Gray “Empty Socket” – non-licensed components

---

**Note**

If a system is unreachable – but not disabled or non-licensed – the last known state of the LED is displayed. An unreachable, or not transmitting system, may still be operational for backups, restore, and replication, but it is not communicating with DD Management Center.

For all three views:

- Hover the cursor over a gray LED in the Replication column to get a link to the Replication Overview, showing the pairs related to this Data Domain system or Tenant Unit.
- Hover the cursor over a red/yellow LED in the Alerts column to get a link to open the Alerts page.
- Use the Sort Ascending option for the Connection Status column to find connection problems on systems.
- If the File System is destroyed or disabled, a red LED is displayed. As a result of this non-activity, Protocols and Replication are affected and display a red LED as well.

For the Systems or Groups views:

- Hover the cursor over an "empty socket" LED to get a link to launch DD System Manager.
- The System Details control (upper-left) launches the System Details Lightbox for the selected Data Domain system.

For the Tenants view:

- When a Data Domain system is offline, the Tenant Units in that system become offline as well, and the Tenant Unit offline icon is displayed in the Tenant Unit tree.
- Unmanaged Tenant Units, as well as MTrees and Storage Units that do not belong to a Tenant Unit, are not displayed.
Only Tenants and Tenant Units that belong to the current user are displayed.
The Tenant Unit Details control (upper-left) launches the Tenant Unit Details
Lightbox for the selected Tenant Unit.

Checking health alerts

In addition to checking Health Status for operational problems, also check the
Health > Alerts page. Be sure to watch for new or repeating alerts.
Use the Systems/Tenants icons at the top right of the page to toggle page content to
show all DD systems or DD systems organized by tenant assignment.
When you select the Tenants icon, note the following:
- The Tenant Unit Details control (top left) launches the Tenant Unit Details
  Lightbox.
- A special “all” Tenant Unit alert is applied to all Tenant Units in the system.

Note
Secure Multi-Tenancy functionality requires DD systems running DD OS 5.5 or later.

The page banner provides summaries of the total number of alerts: those that are
errors and above, and those that are warnings.
At the top right, you can select the Active Alerts or All Alerts tab, depending on what
you need to view. Many, but not all, alerts remain active until manually cleared.
The Date range filters (Last 12 hours, Last 24 hours, Last 7 days, Last 30 days, All
active alerts, and Custom). let you narrow or expand the focus of alert scoping or go
back to a specific point in time.
The column controls sort the alert list by Severity, System Name, Post Time, Class,
Message, and Object ID. The System Name column includes a filter for entering
system name text.
Selecting an alert in the table shows descriptive information about the alert in the
Details and the History panels, at the bottom of the page. To see a summary of the
alert's history, select the More Details link to see a list of every occurrence of the
alert at the site.
To investigate or resolve an alert on a DD system, open the DD System Manager by
double-clicking the alert in the table, or use the Launch DD System Manager control,
which is enabled when a DD system alert is selected.

Note
For additional information on specific alerts, see the Error Message Catalog on the
online support site.

Checking health jobs

In addition to checking Health Status for operational problems, also check the
Health > Jobs page. This page displays information about jobs (also called tasks) that
have been initiated from DD Management Center, including jobs still in progress and
jobs that have completed, whether successfully or not. Details of a task, including its
subtask status, are shown for a selected task in the Details panel.
You can filter jobs by Failed, In-progress, and/or Completed.
You can select a job from the main list and expand the steps to see sub-steps up to 10
levels deep.
Tasks can run on the DD Management Center alone or can run on the DD Management Center and a Data Domain system. For example, the Report Generation task runs solely on DD Management Center. Other tasks, like Upgrade, run mostly on the Data Domain system, but a skeleton process on DD Management Center tracks the task's progress. And still other tasks run mostly on DD Management Center (such as Adding Systems), but have subtasks that run on the Data Domain system. Tasks that run on Data Domain System Manager (native to the Data Domain system) are not shown in the Jobs list – only those tasks that are initiated from DD Management Center are shown.

The displayed list of tasks is dependent on the role:

- A person with a user or limited-admin role on a Data Domain system or DD Management Center sees only the tasks that they initiated on that Data Domain system or DD Management Center.
- An admin on a Data Domain system or DD Management Center sees all jobs on that Data Domain system and DD Management Center.

**Monitoring capacity**

The Capacity pages display information about storage utilization and allows for toggling between managed Data Domain systems, Cloud Tier, and MTrees. Current and historical space consumption, as well as estimate projected near-term future storage needs, can be monitored from here.

**Checking system capacity and disk space usage**

The Capacity > Management page displays storage usage amounts for monitored Data Domain systems (default), DD Cloud Tier, or their MTrees.

*Note*

This guide assumes that you are familiar with capacity terms, as introduced in the *Data Domain Operating System Administration Guide*. See that guide or the DD System Manager Online Help for explanations of these terms.

The Cloud, System, and MTree tabs at the top right of the page allow for a choice in how to display data. The System tab has two views: Systems and Groups, and the MTree tab has views for Systems and Tenants.

Physical capacity (PCM) for MTrees, Tenants, and Tenant Units can be measured and is described in more detail in the next section, *Measuring Physical Capacity (PCM)*.

**Capacity Management/Systems View** is the default view and can:

- Identify systems as targets for new back ups, replication, and migration
- View the amount of data that is written during a particular timeframe, such as a back-up cycle, and determine how much it has been compressed
- Identify systems that have deviated from their norm for compression ratio, and so forth.
- Monitor the capacity of logically grouped or single systems to track usage and identify systems that are using capacity too quickly
- Identify systems that have used all their storage space
- For Extended Retention-enabled systems, identify how much space is available and used on the Archive and Active tiers, and how well it is compressed
• Identify when garbage collection runs and how much space is reclaimed
• Sort the Warning and Critical Capacity Thresholds columns by ascending/descending controls and can be filtered by an entered value (greater, lesser, or equal to entered value).

Space usage amounts are shown for the current time in the **Capacity Usage**.

**Note**

The Space Usage amounts may not exactly match capacity totals that are reported by DD System Manager. Because of the polling delay of up to an hour, DD Management Center reporting will always lag. This is especially true if there is a lot of churn on the monitored system. The discrepancy will be more visible, and there is a possibility that DD Management Center may never catch up with DD System Manager capacity totals.

**Capacity Management/Mtree/View by tenant** can:

• Type a list of comma-separated strings to filter the Tenant Unit column.
• Sort MTrees within a Tenant Unit.
• Monitor the capacity of logically grouped or single systems to track usage and identify systems that are using capacity too quickly

In the **Capacity Usage** section:

• When a Tenant Unit is selected, the information is aggregated based on all MTrees within that Tenant Unit.
• When a Tenant is selected, the information is aggregated based on all MTrees within all Tenant Units pertaining to that Tenant.
• The last row shows aggregated totals.

In the **Measured Physical Capacity** section, note that **Job State** can have one of the following five values:

• Unsupported (Data Domain system does not support PCM features)
• Completed (latest job successful)
• Failed
• In-progress
• None (PCM is supported, but no jobs run)

In the **Charts** area, the **Space Usage**, **Consumption**, and **Data Written** information and can be seen by selecting each in a drop-down list. If there are connected systems with Cloud Tier or Retention Tier, tabs are shown as Retention (for both Cloud Tier and Retention Tier) and Total. New charts for the Cloud Tier are also available.

• Systems that are consuming space at a rate significantly greater or less than their historical norm
• Total capacity, amount that is consumed, and compression ratio (aggregate) for a group of systems
• Data ingest rate for a group of systems, for example, the total data ingest rate for the last 24 hours
• Systems that are out of space or critically low on space or have used all of their storage space
• The amount of data that was backed up the previous night (24 hour period), and the compression ratio for a group of systems
• The last time that garbage collection was run and how much space was reclaimed
• Select multiple systems and see aggregated information

Measuring physical capacity

*Physical capacity measurement (PCM)* provides space usage information for a subset of storage space for MTrees, Tenant Units, and Tenants.

Data Domain PCM measures the physical capacity consumed by a subset of files within the file system, based on how the files in the subset deduplicate with other files in the subset. In other words, it measures the physical capacity that would be consumed on a Data Domain system by a set of files, if that set of files were the only files on the Data Domain system. This is a *point in time* measurement, based on when the measurement is requested.

You can specify the file system subset to measure in several ways: as an MTree, a Tenant Unit (all files within a Tenant Unit), or a Tenant (all files within a Tenant). Since a Tenant can span Data Domain systems, in this case DD Management Center measures and reports the physical capacity consumed by the Tenant on each Data Domain system.

The results of PCM jobs are retained for no more than one result per hour for the last 90 days, then no more than one per day for the last year, and then no more than one per week for the last 10 years.

Managing measurement schedules for physical capacity

You can management measurement schedules for physical capacity using the Manage Measurement Schedules dialog.

**Note**

You cannot directly *add up* Physical Capacity Measurements because a certain amount of *sharing* occurs between MTrees, so any totals generated can often be misleading. In the following picture, the Tenant Unit's information is stored on three MTrees, but there is sharing among those MTrees, so the actual total would be less than simply adding up the space used by the Tenant Unit.

Schedules may be consolidated on multiple Data Domain systems, as follows:
• If two or more schedules have the same name, type, and schedule (for example, “every Monday at 7 AM”), DD Management Center displays one schedule configured on different Data Domain systems.

• If two schedules have the same name, but different types and/or different scheduled times, DD Management Center displays two schedules.

• If a schedule is Disabled on one Data Domain system, but Enabled on another, DD Management Center displays one schedule.

**Note**

Refresh can take up to one hour if these changes are made through the command-line interface (CLI).

**Procedure**

1. Select **Capacity > Utilization > MTree tab > Physical Capacity Measurement menu > Schedules**

2. In the Manage Measurement Schedules dialog, you can add a new schedule, edit an existing schedule, or delete a schedule.

3. For existing schedules, expand the arrow at the left to display the entities that belong to the selected schedule:
   - **Schedule** shows the current schedule, such as *Daily at 12:00*.
   - **Type** can be *MTree, Tenant Unit, or Tenant*.
   - **Status** indicates whether the schedule is *Enabled* or *Disabled*. If disabled, it will not run at the scheduled time.

**Note**

If the schedule was enabled on some Data Domain systems and disabled on others, selecting *Enable* will enable it on all Data Domain systems. Likewise, selecting *Disable* will disable it on all Data Domain systems.

- **In Use** displays *Yes* if any entities are assigned to this schedule.

4. Select **Close** when you are finished.

**Adding or editing physical capacity measurement schedules**

You can add or edit physical capacity measurement schedules using the Manage Measurement Schedules dialog.

**Note**

If you change the name of a Tenant that is part of a PCM schedule, the name change is not updated automatically in the schedule. You must manually add the new Tenant name to the PCM schedule.

**Procedure**

1. Select **Capacity > Management > MTree tab > Physical Capacity Measurement > Schedules**

2. In the Manage Measurement Schedules dialog, select Add (green plus sign), or select a schedule and select Edit (yellow pencil).

3. In the Add a Schedule or Edit *schedule* dialog, enter or edit the following information:
• **Status** is displayed only for editing. Select *Enabled* or *Disabled*.
• **Name** can be entered only for a new schedule. You cannot edit the name after the schedule has been created.
• **Every** can be *Day*, *Week*, or *Month*. Selecting Week or Month will bring up a weekly or monthly calendar where you can select the days of the week or days of the month.
• **Scope** indicates whether the schedule is *MTree*, *Tenant*, or *Tenant Unit*. You cannot create a schedule with different types of entities; however, you must select one to create a schedule. You cannot edit the scope after it has been created.
• **Assignment** displays *Yes* if any entities are assigned to this schedule.

4. Select **Add**.

Deleting physical capacity measurement schedules

You can delete physical capacity measurement schedules using the Manage Measurement Schedules dialog.

**Procedure**

1. Select **Capacity > Management > MTree tab > Physical Capacity Measurement > Schedules**
2. In the Manage Measurement Schedules dialog, select a schedule, and select **Delete** (red X).
3. In the Delete *schedule* dialog, select the down arrows beside **More information** to see the entities assigned to this schedule.
4. Select **Yes** or **No**.

Assigning and unassigning measurement schedules for physical capacity

You can assign and unassign measurement schedules for physical capacity of MTrees, Tenant Units, or Tenants, using the Assign/Unassign Schedules dialog. Assigning a schedule to a Tenant will measure that Tenant on all DD systems used by the Tenant.

**Procedure**

1. Select all or multiple MTrees, a single MTree, a Tenant Unit, or a Tenant for which you want to assign or unassign schedules.
2. Select **Capacity > Management > MTree tab > Physical Capacity Measurement menu > Assign/Unassign Schedules**.
3. In the Assign/Unassign Schedules to *entity* dialog, you can move schedules from the Available Schedules list to the Assigned Schedules list, and vice versa, using the arrows. The double arrows (>> and <<) move everything. The single arrows (>) and (<) move only the selected schedule.
4. Select **Save** or **Cancel**.

Measure now for physical capacity

You can perform a *measure now* task, that is, a one-time measurement, for physical capacity of MTrees, Tenant Units, or Tenants, using the Measure Now dialog box.

**Procedure**

1. Select all or multiple MTrees, a single MTree, a Tenant Unit, or a Tenant that you want to *measure now*.
2. Select Capacity > Management > MTree tab > Physical Capacity Measurement menu > Measure Now.

3. In the Measure Now dialog box, you can select Hide to keep the process going, but to not show the dialog box. You can monitor progress on the Jobs page.
   a. If the job submits successfully, a success message is displayed.
   b. If the job fails, the reason for failure is displayed when hovering over the "Failed" status.
   c. For entities associated with multiple Data Domain systems (a single Tenant or multiple MTrees), if an error occurs, a table with the error on a per Data Domain system basis is displayed.
   d. After the job starts, it may take some time for it to complete.

   **Note**
   A physical capacity measurement takes roughly the same time as a cleaning cycle. This might be hours or, in extreme cases, days. Timing depends on the current workload of the Data Domain system and how much data is in the MTree, Tenant Unit, or Tenant.

   It may take up to an hour for the physical capacity measurement data to show up on the MTree pages after the job is completed.

**Viewing physical capacity measurement jobs**

Use the View Measurement Jobs dialog to view physical capacity measurement jobs, for either an MTree, a Tenant, or a Tenant Unit.

**Note**

The number of physical capacity measurement samples presented by the DD Management Center is typically different from the number of samples shown by the Data Domain Operation System (DD OS). DD Management Center displays more samples because it does not do any pruning on physical capacity measurement samples. The DD OS prunes historical physical capacity measurement samples for MTrees, Tenant Units, and Tenants on a daily basis and keeps the distribution of historical samples for no more than 1 sample per hour for the last 90 days, then no more than 1 per day for the last year, then no more than 1 per week for the last 10 years.

**Procedure**

1. Select Capacity > Management > MTree tab > Physical Capacity Measurement > View Measurement Jobs
2. In the View Measurement Jobs for entity dialog, observe the combined list of physical capacity measurement jobs that are In-progress, Completed, and Failed, starting with the most recent.
3. Select Close.

**Checking projected system capacity**

The Capacity > Projected page helps you plan future capacity needs.

You can use this information to:

- Predict when systems will run out of storage space or reach a critically low point
• Determine future capacity needs by projecting historical and current trends
• Determine targets for migration by projecting the systems that are filling up, versus the same model systems that will have space available
• Perform CSV export

Each entry in the table shows the system name and a connection status icon with a pop-up containing a link to the Health > Alerts page. The space usage amounts (size, used, and free) for current and projected months are provided. A storage graphic depicts the system’s capacity by percentage used, with color coding to show normal, warning, and critical threshold levels. This graphic is a thumbnail version of the default projection chart at the bottom of the page.

The Projected Capacity (By Date) control presents information in three groups of columns. There is also a sparkline chart to present the general shape of the variation.

• 100% Capacity shows the projection when the Data Domain system will be 100% full, based on the automatically determined growth rate.
• Projected Capacity lets you compute the used capacity on a specific date. The Data Domain system might have free capacity, be full, or be overfull. These columns project just how much over capacity the Data Domain system will be, so you know how much capacity you need to free up or buy.
• Current Capacity simply shows the current state of the Data Domain system, which is the same as the Capacity > Utilization page.

If insufficient data prevents an accurate projection, informational messages are displayed.

**Table 10 Insufficient data messages**

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data is no longer being added to system.</td>
<td>The used capacity is basically flat, so predictions are unreliable.</td>
</tr>
<tr>
<td>Projection cannot be made.</td>
<td>The projection failed for unknown reasons.</td>
</tr>
<tr>
<td>Projection cannot be made because the average space used in the last 7 days is less than 10%.</td>
<td>The Data Domain system has so little data that the file system is less than 10% used. A projection cannot be made when such a small amount of capacity is used because it is unreliable.</td>
</tr>
<tr>
<td>Projection cannot be made because of insufficient data. A minimum of 15 daily space usage points is required for projections.</td>
<td>At least 15 days of data is required to make a reliable projection.</td>
</tr>
<tr>
<td>• Projection cannot be made because of a large recent drop in space used.</td>
<td>A regression was computed, and the slope is negative (that is, capacity is freeing up, not being consumed), and the fullness date is in the past.</td>
</tr>
<tr>
<td>• Projection cannot be made because the usage trend is not consistent during the past 15 days.</td>
<td></td>
</tr>
<tr>
<td>Projection cannot be made because the space used varies too greatly during the past 15 days.</td>
<td>The last measured usage point is below the confidence interval of the projection. The confidence interval is the 95% band, that is, for 95% of the time, the actual data points should be within the confidence interval.</td>
</tr>
</tbody>
</table>
Table 10 Insufficient data messages (continued)

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The most recently measured point is lower than the lowest value expected with 95% confidence.</td>
<td></td>
</tr>
<tr>
<td>Projection cannot be made because a specific pattern based on the most recent space usage data cannot be determined.</td>
<td>A regression was computed, but the best regression does not match the actual measurements very closely. Technically, this result indicates that the $R^2$ value (the “coefficient of determination”) is less than 0.8. [An $R^2$ value of 1 means a perfect fit was found. A value of 0 means no correlation was found at all.] This $R^2$ value means that capacity is not being used in a smooth, linear fashion. It is either being consumed at a varying rate or varying between being used and freed up. (See Space projection algorithm for DD Management Center on page 59 for more about $R^2$.)</td>
</tr>
</tbody>
</table>

Date column data (Current, and those selected using the timeline) can be sorted by amount of Used Space, Free Space, % Used, and Size in rising or descending order. Highlighting a system in the list activates controls for interactively customizing the projection and launching the DD System Manager.

**Interacting with the Projection Chart**

You can perform a custom projection using the interactive Projection Chart at the bottom of the Capacity > Projected page.

**Procedure**

1. To adjust the visible range of data shown in the chart (this does not change the projected dates):
   - In the Date Range control, at the top left of the chart, simply select 1w, 1m, 3m, 1y, or All. The input fields at upper left change the visible range of data, and those on the right change the projection dates.
   - Enter specific dates in the date input fields.
   - To change the projections, you can slide or adjust the gray area in the chart. You can move these controls to the left or right, or you can make the chart wider or narrower, to fit a time range you believe is more representative than the one DD Management Center computed as the best fit.

   A better correlation between the projected trend line will show a narrower confidence range around the projected trend line. A less satisfactory correlation will show a wider confidence range.

2. In the Dates used for making projections control, at the top right of the chart, the dates will update to reflect the customized projection.

3. Use the Defaults button to return to the default/best fit projections.

**Checking the System Details lightbox**

The System Details lightbox provides detailed operating information about specific components of a Data Domain system.

There is a System Details control on all of the following pages:
- **Health > Status**
- **Capacity > Utilization**
- **Capacity > Projected**
- **Replication > Overview**
- **Inventory > Systems**

To activate the control, you must first select a Data Domain system from the table. There are five tabs for non-HA systems, and six tabs for HA systems.

The **Overview** tab shows the operational status of various system components (such as the file system and protocols) using LED status indicators. Also provided are summaries of file system usage and capacity, and replication status and statistics for inbound and outbound replications.

The **Capacity** tab shows different tier data if applicable. If this is a single-tier system, there will be only one column. If this is a cloud or extended retention tier system, then there will be Active tier, Cloud or Retention tier respectively, and total columns. This tab will also contain a Capacity usage chart and a table with MTrees on that system.

The **Network** tab shows total bytes, backup and restore bytes, and replication inbound and outbound bytes. There is a network byte chart as well.

The **Charts** tab lets you produce charts for selected time intervals. System Charts tab has all of the system charts. For cloud enabled systems, charts are broken into two sections - Historical, which contain the same charts as before, and a new Current charts section, which contains two pie charts that show the current distribution of data on the systems and cloud providers. These charts are:

- Protection Distribution - a chart showing how much data resides on-premises versus on different cloud providers.
- Licensed Capacity Usage - Space that is used on each provider, space available, and total capacity licensed for all the providers combined.

The **Replication** tab lists the counts of different automatic/on-demand replication pairs, both inbound and outbound, with ones that have errors or warnings. There are also inbound and outbound charts.

The **HA** tab, for an HA system, contains the HA system health diagram which marks alerts, if any, in each component of the HA system. Selecting different components in the diagram can filter the alerts that are viewed in the table.

**Resource charts**

- **CPU utilization** shows the CPU utilization percentage for the Data Domain system by date and also shows when cleaning is being performed.

- **Network throughput** shows whether a Data Domain system is experiencing bandwidth-related bottlenecks. You can determine how much network bandwidth is being used by Data Domain systems sharing the same subnet to see if any are using more than expected or allowed by IT departments.

**File system charts**

- **Streams counts** shows the numbers of each type of stream that were open at the date and time that is indicated for each data point. It is not an aggregate (average, min, or max) of the stream count over the selected interval. It is best viewed at the lowest interval (hourly), so that hourly stream count throughout each day can be observed. At greater intervals (daily or weekly), only a single data point, which is taken at noon, is shown, which is not helpful in determining how many streams were open throughout the day or week. In summary, the hourly interval is the best choice for viewing this chart.
• **Protocol processing** shows the number of operations per second.

• **Protocol throughput** shows the following:
  - **Data in** is the amount of data that the DD OS file system can read from the kernel socket buffer.
  - **Data out** is the amount of data that the DD OS file system can write to the kernel socket buffer.
  - **Wait Time per MiB in** is the amount of time it takes for the DD OS file system to receive one mebibyte of data from a network client. A high value indicates that the client is sending data relatively slowly and any performance issues are likely to be related to the client or network. A low value indicates that data is arriving from a network client as fast or faster than it can be deduplicated and written to disk.
  - **Wait Time per MiB out** is the reverse metric, the amount of time that is taken to send a mebibyte of data from the DD OS file system to a network client. A low value indicates that data can be sent over the network as fast as it is being read from disk. A high value indicates that data is being read from disk faster than it can be accepted by the network and network client.

*Replication charts*

• **Inbound characteristics** shows the inbound counts for both automatic and on-demand replication pairs.

• **Outbound characteristics** shows the outbound counts for both automatic and on-demand replication pairs.

• **Throughput** shows throughput for both automatic and on-demand replication pairs.

**Monitoring replication**

The Replication pages provide status and performance details about replication pairs – organized by Data Domain systems, Groups, or Tenants. For each page, you can view either pairs, cascades, or topology by selecting the controls at the top right.

For Tenants – in the Replication > Overview > All Pairs page:

• Grouping hierarchy is Tenant, Tenant Unit, Inbound/Outbound, Automatic/On Demand, Replication pair. If there are no application replication pairs, the corresponding row will not appear.

• If a Tenant Unit has no MTrees or Storage Units participating as a Source or Destination, that Tenant Unit is not displayed.

• MTrees and Storage Units that are not assigned to any Tenant Units are not displayed, even if they may be a source or destination. Similarly, if all Tenant Units in a Tenant have no MTrees or Storage Units with Replication contexts, that Tenant is not displayed.

• RBAC (role-based access control) also affects the Tenants and Tenant Units that are displayed.

• The CSV (comma-separated values) file will contain these addition columns: Tenant, Tenant Unit, Source Tenant, Source Tenant Unit, Destination Tenant, Destination Tenant Unit. It will not contain the System column.

• Replication pairs are grouped by the Tenant or Tenant Unit to which the source or destination MTrees or Storage Units belong.

• A pair will be listed twice when the source and destination belong to different Tenant Units.
For Tenants – in the Replication > Overview > Topology page:

- The source or destination shows the Tenant Unit name if the MTree or Storage Unit belongs to a Tenant Unit.
- Tenant Units are shown inside of systems. The Tenant name is shown above the Tenant Unit icon.
- Tenant Units can be expanded just like systems.
- MTrees that do not belong to a Tenant Unit are displayed if one end of the pair belongs to a Tenant Unit.
- Tenant Units not assigned to a Tenant are displayed if one of their MTrees or Storage Units has a replication to or from an MTree or Storage Unit belonging to a Tenant Unit.
- Cascaded replications are still displayed if they include data that originates from or is replicated to a managed Tenant Unit.
- The context menu for a Tenant Unit includes menu items for Tenant and Tenant Unit detail lightboxes.
- You can choose the related pairs view for a Tenant Unit or Tenant.
- The related pairs view for a Tenant shows all Tenant Units from that Tenant, as well as incoming, outgoing, or cascaded pairs from its Tenant Units.

For Tenants and Systems – in the Replication > Overview > All Pairs page:

- Each monitored Data Domain system or Tenant that has configured replication pairs is listed.
- Expand an entry to see its inbound and outbound replications, and for these, expand to see the replication type: Automatic (Data Domain system to Data Domain system replications) and On-demand (client-initiated and controlled replication of DD Boost files), and expand those to see the pairs of that type. The Inbound and Outbound entries are shown only when applicable.
- Use the column selector to display columns for replication status, number of pairs (totals for systems, inbound, and outbound replications), and a selectable/configurable time-interval for displaying historical replication data.
- Double-click a status error icon at the system level to open the System Details Lightbox, where hovering on the Replication LED exposes a pop-up with a link to the Alerts page, filtered for the pairs in error. The Status error icon for a category (inbound, outbound, system) shows if any of its items has an error condition.
- Use the right triangle System control at the top left of the table to expand the inbound and outbound tiers to see all Automatic and On-Demand replications (if the system entries have not been expanded yet), and also to collapse all expanded entries.

For Systems, Groups, or Tenants – in the Replication > Automatic page:

- All monitored Data Domain system replications for directory, collection, and MTree replication are listed.
- The page banner displays the total count of monitored Automatic replications, and the table shows for each replication pair selectable columns for the status, source and destination systems, and performance data, such as lag time (the lag cell is red when lag duration is greater than or equal to the Critical threshold and yellow for Warnings; hover over the cell for detailed information about the lag threshold), lag trend (increasing – the data cannot be replicated within the lag threshold), steady, decreasing, or no arrow if the pair is suspended or in error), time over threshold (hover to see policy settings), bytes remaining, and status message text.
The page-specific controls include Assign Properties and Lag Threshold Policy/Manage Lag Threshold Policies to set/manage alerting for when an Automatic Replication lag time exceeds the set time limit for critical and warning levels.

For Systems, Groups, or Tenants – in the Replication > On-Demand page:

- Historical data for completed replications can be viewed for the past 24 hours, 7 days, 30 days, 90 days, or by setting a custom time frame.
- Details shown are for Pre-comp data replicated, completed and failed replicated files, percentage of failure, and the last error messages.
- For the group view, data for pairs are rolled up at each group level. Data for all pairs are summarized at the last line of the table.
- The number of completed and failed files can include file replications that the system retried up to four times due to generally recoverable failures. Consequently, the sum of the completed and failed file replications can be greater than the total number of file replications that were initiated by the DD Boost applications on the replication pair.
- DD Boost file replications are listed (for systems running DD OS 5.3.1 or later), showing for the pair: the last transfer status, source and destination storage units, and performance data for recent and completed replications. The table can organized by Pairs or Groups (toggle at top right).
- If the source or destination fields show an IP address instead of a host name, the DNS server configuration for the Data Domain system must be modified. When configuring Data Domain systems to monitor DD Boost (on-demand replication), ensure their DNS servers include configuration for both forward and reverse host name lookup. Without proper DNS server configuration, Data Domain systems will not be able to translate from IP addresses to host names, and the source and destination paths will contain IP addresses instead of host names.
- The replication Pair Details control is active when a pair is selected and shows a lot of replication detail.
- The System Details control is active when a Data Domain system entry is selected on the Overview page.
- The Export CSV file control sends the overview listing with performance data for the last 7 days to a file with comma-separated values (for viewing in Excel, for example).

**Viewing replication topology to investigate error conditions**

When the Topology view is selected on the Replication > Overview page, it shows the relationships of the site's configured replication contexts and uses color-coded status indicators and other map controls to let you easily locate and drill-down to investigate error conditions.

Use the Type menu to select the replication types that are shown in the map work area (MTree, directory, collection, and on-demand files). If a replication type has not been configured among the site's replications, its checkbox in the menu is disabled. If a type is enabled but de-selected, those node relationships do not show on the map.

A slider on the map controls the scope of replication contexts that are shown in the work area display.

The inset is a miniature representation of the map and its scope is controlled by the slider manipulation. The inset itself can be selected and moved around to include or exclude systems in the map work area.
Replications statuses between systems are shown with color-coded directional lines, which will show red if any of the replications is in error. Hovering over the line shows the number of replication pairs and a count for each status level.

The action buttons above the graph correspond to the selected item in the graph. Selected items can be:

- System (Buttons for system details and launching DD System Manager will show.)
- Tenant Unit (Buttons for tenant or tenant unit details will show.)
- Property or Data Set (MTree, directory, collection, etc.)

Use the actions items to show Related Items and Connected Items available for any object selected in the graph to show an in-depth view of all replication pairs that are configured. Items related to a selection will include all pairs with direct replications or cascades connected to the selected items. The Connected Items button will filter to show a connected graph containing the selected item. (A graph is connected if there is a path between every pair of graph nodes.)

The right panel lists the Replicated Pairs (of highlighted systems in the map work area or all contexts if nothing is highlighted), showing the type of context, source and destination systems, status, with a link to additional details. Selecting a context activates the Pair Details control.

### Checking the Replication Pair Details lightbox

Selecting a replication pair on any of the Replication pages activates the Pair Details control, which opens the Replication Pair Details lightbox.

There are two tabs: Overview and Charts.

The Overview tab shows:

- The last transfer status
- The source and destination systems
- Settings such as encryption and operational status
- Color-coded icons showing capacity levels

The Charts tab provides graphs for:

- Pair characteristics - performance factors, such as pre-compression written, pre-compression replicated, post-compression replication, pre-compression remaining, network bytes, and compression ratio.
- Lag trend - charts pre-compression remaining, replication lag, pre-compression written, warning threshold, and critical threshold (not available for on-demand replication)
- CPU utilization
- Data written
- Network and replication throughput
- Source and destination characteristics, as well as common pairs

The charts are vertically aligned for source and destination systems by the same time interval, allowing comparisons for both systems at any point in time.

### Possible reasons for “SU is unresolved” message

If a Storage Unit for a DD Boost replication pair shows the message, “SU is unresolved”, here are some possible reasons:
- The remote system is not registered with DD Management Center.
- Both systems are registered, but one is running an unsupported DD OS version and is not able to report the Storage Unit name.
- The remote hostname is an IP address and cannot be matched to a registered hostname.

**Monitoring status with reports**

Reports compile information for areas of interest on managed Data Domain systems and for Secure Multitenancy (SMT) and DD Cloud Tier. Reports are generated based on default report template types. Report templates configure the report’s content, schedule, and email distribution.

**Note**

If a user who is the “owner” of any report templates is deleted from the CLI, those report templates will still appear to be owned by the “deleted” user, but the reports will no longer run at their scheduled times.

There are three default report template types for Data Domain systems:
- Capacity (Capacity Overview)
- Replication (Replication Status)
- Status (Current Health Status)

There are two default report template types for SMT and DD Cloud Tier:
- Status (Daily Status)
- Usage (Usage Metrics)

**Creating a report with the wizard**

The Add Report Template wizard creates a report template for use in running reports about key data points.

**Note**

The number of physical capacity measurement samples presented by the DD Management Center is typically different from the number of samples shown by the Data Domain Operation System (DD OS). DD Management Center displays more samples because it does not do any pruning on physical capacity measurement samples. The DD OS prunes historical physical capacity measurement samples for MTrees, Tenant Units, and Tenants on a daily basis and keeps the distribution of historical samples for no more than 1 sample per hour for the last 90 days, then no more than 1 per day for the last year, then no more than 1 per week for the last 10 years.

**Procedure**

1. Select **Reports > Management**.
2. Select Add (green plus sign).
3. In the Add Report Template dialog, select the type of report you want (System Reports, Multitenancy Reports, or Cloud Reports), and select **Next**.
4. Enter a name, and select a Template. Choose one or more Sections to include, and select Next.
   a. For System, the choices are Capacity, Replication, or Status.
   b. For Multitenancy, the choices are Status or Usage.
   c. For Cloud Tier, the choices are Status or Usage.

5. Depending on whether you selected System, Multitenancy or Cloud Tier:
   a. System: Select a filter to narrow the scope of reported objects (for example, filter by selected groups). Select the time span for data collection (for example, last 24 hours), and the report retention (for example, 7 days). Select Edit to set a schedule for the frequency and time the report is run. Report generation time will be two hours ahead of Starts On time. Select Next.
   b. Multitenancy: Select a Scope (Tenant Unit or Tenant). The Daily Status report is always configured to show the last 24 hours of historical data, and you can select the Report retention (Forever, 7 days, 30 days, 90 days). The Usage Metrics report (which is generated as an Excel spreadsheet) lets you display data for a full month or a full week. Select Edit to set a schedule for the frequency and time the report is run. Report generation time will be two hours ahead of Starts On time.
   c. Cloud Tier Reports: Select Cloud Service Providers to filter the systems that have cloud tier configured to connected to them.

6. Optionally, add recipient email addresses (for when the report completes and/or if an error occurs). For the Tenant Unit report template, the Tenant Unit admin emails will be added by default. For the Tenant report template, the Tenant admin email will be added by default. You can manually add or remove these emails. Select Next.

7. Review the details, and select whether to save the template for later use and/or to run the report immediately. Select Finish.

Results
After it has been created, a report template is added as an entry in the reports table. When selected, the report template can be used to immediately run a report, or it can be edited or deleted, or the time it was last run can be displayed.

Generating a report immediately
To generate a report immediately, select a report template listed in the Template name table, and select Run Report.

A report (named by concatenating the data stamp to the template title) is created and opened as a PDF file in your browser, except for the Tenant Usage report, which generates an .xlsx file.

The report generation information is listed in the Report History table, where it can be viewed, renamed, or deleted.

Cleaning up reports from deleted users
Report templates owned by deleted users can be deleted, or re-assigned to another DDMC user.

Users can be deleted from the Settings > Access > Local Users window.

When deleting a local user, DDMC provides the option to select another local user to own the deleted user's report templates, or delete the report templates along with
their owner. Report templates are re-assigned to sysadmin by default, but any local user can be selected.

If the report templates are re-assigned, the report schedules are disabled by default until the email recipients for the report are updated. Report templates can be updated from the Report Management window, or the Edit button on the Schedule tab.
CHAPTER 5
Managing Data Domain Systems

- Launching Data Domain System Manager.......................................................... 82
- Upgrading Data Domain system software....................................................... 83
- Local users...................................................................................................... 85
Launching Data Domain System Manager

From some DD Management Center pages, you can launch a Data Domain System Manager (DD System Manager) session, for the selected Data Domain system, to perform configuration or troubleshooting. The launched version of DD System Manager actually runs on DD Management Center – not on the Data Domain system, which gives a centralized, secure, and simultaneous administration for multiple Data Domain system.

To start a session, select an entry in a table listing (for example), and select Launch DD System Manager from any of the following DD Management Center pages:

- Health > Alerts
- Health > Status
- Capacity > Management
- Capacity > Projected
- Inventory > Systems
- Replication Pair Details
- System Details

**Note**

Ensure that the pop-up blocker on your browser is configured to allow pop-ups for DD Management Center.

The DD System Manager session that starts (in a new window) requires no login or logout and provides complete management of the Data Domain system. DD System Manager opens showing the corresponding area from where it was launched (for example, if the launch was from the Alerts view, the Alerts page on the Data Domain system is opened).

The launched DD System Manager appears the same as a native DD System Manager session. The banner shows the Data Domain system name, OS release, and model type, as well as the management role (e.g. admin).

**Note** the following about launching DD System Manager from DD Management Center:

- You can launch DD System Manager for a system for which you have an *admin*, *limited-admin*, or *user* role.
- A permission is composed of a system or group, a user (local or NIS), and a role.
  - The administrator role is required for replication configuration and IPMI configuration.
- The inventory of Data Domain systems on DD Management Center is used.
  - The Data Domain systems that are shown are based on the effective permissions.
  - Only replication source and destination systems that are registered with DD Management Center are shown.
- Additional firewall ports for the session do not need to be opened. After a Data Domain system is added to DD Management Center, the existing port assignments are used for the DD System Manager connection.
Upgrading Data Domain system software

You can upgrade the DD OS on one – or a group of – Data Domain systems, if you have admin rights on those systems and on DD Management Center.

Procedure

Note

HA systems cannot be upgraded from DD Management Center. Launch DD System Manager for the HA system and perform the upgrade on the system itself.

1. Get a DD OS upgrade package, by downloading an upgrade package from the online support site at https://support.emc.com/.
2. Upload the DD OS upgrade package to the DD Management Center inventory.
3. Perform the DD OS upgrade on the Data Domain system(s).

Managing Data Domain system upgrade packages

Before you can upgrade a Data Domain system through DD Management Center, you must upload the upgrade package to the DD Management Center.

Procedure

1. Select Inventory > Systems.
2. Select a Data Domain system or systems.
3. If the currently selected system(s) allow an upgrade, the banner will display Upgrade. In this case, select Manage Upgrade Packages from the drop-down list.
   
   If the currently selected system(s) do not allow an upgrade, the banner will display Packages. You can still select Manage Upgrade Packages from the drop-down list.
4. In the Manage Upgrade Packages dialog:
   
   - To download a package, select the online support link, and store the package locally.
   
   - To upload a package to the DDMC, select Add (green plus sign), and browse to the local drive to select the package. (You can also go to the online support site through this dialog.)
   
   - To delete a package, select the package and then select Delete (red X).
5. After the upgrade package has been uploaded to the DD Management Center, you can upgrade one or more Data Domain systems.

Performing a Data Domain system upgrade

The DD OS on one or more Data Domain systems can be upgraded from DD Management Center with one upgrade operation. If systems are not in an acceptable managed state (for example, unreachable, suspended, upgrading) the upgrade action is unavailable.

Procedure

1. Select Inventory > Systems.
2. In the Inventory table, select one or more target systems for the DD OS upgrade.
   Make sure the OS column is visible.

3. From the Upgrade menu, select **Upgrade**.

   **Note**

   HA systems cannot be upgraded from DD Management Center. If one or more HA systems is selected, DD Management Center displays a message stating that upgrades for HA systems are not supported.

4. In the Upgrade Systems dialog, at the top right, select the desired DD OS version from the drop-down list.

   Versions in this list have already been either downloaded from the online support site or uploaded from a local drive, as described in the previous section.

   All errors must be removed before the upgrade is allowed. Errors can be removed by removing the offending system from the list, or possibly by changing the target upgrade version. You may choose to correct the condition separately, and try again later.

   To see more detail for an error, select the > beside the error.

   Some error conditions include:

   - The RPM is less than or equal to the current version.
   - The RPM is two version higher than the current version.

   A warning is displayed if upgrading could break an existing replication pair, but the upgrade is not disallowed.

   If there are no packages in the DD Management Center inventory, select the **Add packages** link, and you will see the **Add Upgrade Packages to DDMC** dialog. Press **Browse** to find an RPM file previously downloaded to your system to upload to DD Management Center. Press **Add** to upload the RPM file.

5. Select **Add** to initiate the selected system upgrade.

6. Select **Next**.

   The progress bar will display **Upgrade Pre-Condition Summary (Step 2 of 3)**.

7. Once the progress bar displays, **If you are ready to proceed, click Upgrade ...**, select **Upgrade** to be taken to Step 3.

8. **Upgrade Progress (Step 3 or 3)** should appear, which will display the upgrade progress and any errors encountered.

   **Note**

   Depending on the number of Data Domain systems selected for the upgrade and other factors, the upgrade may take a long time. After the upgrade, each Data Domain system automatically reboots. File access is interrupted during the upgrade. Progress for the upgrade can be tracked on the **Health > Jobs** page.
Local users

Local users are non-administrative users that can log into DD Management Center, but can only view systems specified by an administrator.

Creating access for users

To set up access to DD Management Center, you must add users and access groups, as well as add permissions for certain roles.

Procedure

1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Local Users.
2. Click Add to create users.
   These users can log into DD Management Center, but cannot see any other systems. You can add permissions to view (user role), administer (admin role or limited-admin), or take snapshots (backup operator) for groups and Data Domain systems.
   User groups have either admin or user roles; user roles can be admin, limited-admin and user. If a user or a user group has the admin role, they can view all Data Domain systems by default; it is not necessary to set any other permissions for admin users and groups.
3. Access Authentication to create access groups (NIS and Active Directory) in DD Management Center.
4. For users and user groups with the user role, you must set permissions on Data Domain systems so they can view the systems. Select Administration > Permissions.
5. Select Add (green plus sign).
6. In the Add Permissions dialog, select where to add the permission:
   • Add permissions to systems – Select this option, and from the list of managed Data Domain systems, select the checkboxes of the systems where the permissions are to be assigned.
   • Add permissions to groups – Select this option, and from the list of groups, select the checkboxes of the groups where the permissions are to be assigned.
7. In the User area, select Add (green plus sign), select one or more users from the Select Users dialog, and select Select.
8. Click in the Role field for the user, and select the access role: Administrator, Limited-Admin, Backup Operator, or User.
9. Select Add (green plus sign).
   The users are given the assigned role (Administrator, Limited-Admin, Backup Operator, or User) for the selected systems or groups.

After you finish

To simplify the management of permissions:

• It is recommended that the use of the admin role for the DD Management Center be minimal.
The admin role can manage all Data Domain systems in the DD Management Center inventory. In addition, the admin for the DD Management Center configures the DD Management Center properties and groups and assigns its permissions.

- Configure most logins for DD Management Center with the user role.
- Use NIS user groups for permissions – this simplifies the process for adding, removing, and modifying users without changing the permission assignment.
- Use Data Domain System Groups for permissions rather than assigning permissions to individual systems. By assigning permissions at the group level, policy-based permissions can be used with a union model that is applied to the entire group hierarchy.
- Start with lower level permissions at the top of the hierarchy:
  - Assign lower level permissions toward the root of the Group hierarchy.
  - Assign higher level permissions toward the leaf of the Group hierarchy.
  - Use a union model, not an override model. This makes it easy to change permissions at lower levels without affecting the entire hierarchy.

Verify Changes:
- After assigning permissions or changing group membership, verify the change by looking at the Effective role for a system.

Use Central Administration:
- Use DD Management Center to centrally administer all systems, reducing the use of local accounts on each managed Data Domain system. Turn off direct GUI access to Data Domain systems that are managed by DD Management Center.

Understanding DD Management Center permissions

The Administration > Permissions pages (Assigned, Groups, Systems, Users) show the permissions of DD Management Center users by assigned role.

Permissions are a “triangle” of three components:
- the managed object (groups or systems)
- the user (local, NIS, or Active Directory)
- the DD System Manager role (Administrator, Limited-Admin, Backup Operator, or User)

The Permissions pages are also used to add, modify, and remove permissions from groups and systems. Each of the views show the users, their assigned roles, and their effective roles.
CHAPTER 6

Administering Secure Multi-tenancy

- How DD Management Center helps with SMT monitoring ........................................ 88
- Creating and managing Tenants ........................................................................ 96
- Creating and managing Tenant Units ................................................................... 99
- Creating, editing, and generating SMT reports ..................................................... 110
How DD Management Center helps with SMT monitoring

DD Management Center can configure and monitor Secure Multi-Tenancy (SMT) for
DD Boost backup and replication storage on multiple Data Domain systems.

In a secure multi-tenant environment, storage administrators (landlords) and backup
administrators (tenants) cooperate to allocate and manage storage, as follows:

Note

Secure multi-tenancy is not supported on DD VE 2.0 instances, but it is supported on
DD VE 3.0 and later.

1. The storage administrator creates Tenants on DD Management Center.
   For example, the storage administrator in a corporate IT organization might create
   a Tenant for the backup administrator in the finance department.

2. The storage administrator creates one or more Tenant Units on Data Domain
   systems to serve as virtual containers for each Tenant.

3. The storage administrator creates one or more MTrees and/or DD Boost Storage
   Units.

4. The backup administrator configures backup software to use the MTrees in the
   Tenant Unit as storage targets.

For more information, see the “Data Domain Secure Multi-tenancy” chapter of the
Data Domain Operating System Administration Guide.

Data Domain Secure Multi-tenancy overview

Data Domain Secure Multi-tenancy (SMT) is the simultaneous hosting, by an internal
IT department or an external provider, of an IT infrastructure for more than one
consumer or workload (business unit, department, or Tenant).

SMT provides the ability to securely isolate many users and workloads in a shared
infrastructure, so that the activities of one Tenant are not apparent or visible to the
other Tenants.

A Tenant is a consumer (business unit, department, or customer) who maintains a
persistent presence in a hosted environment.

Within an enterprise, a Tenant may consist of one or more business units or
departments on a Data Domain system configured and managed by IT staff.

- For a business unit (BU) use case, the Finance and Human Resources departments
  of a corporation could share the same Data Domain system, but each department
  would be unaware of the presence of the other.
- For a service provider (SP) use case, the SP could deploy one or more Data
  Domain systems to accommodate different Protection Storage services for
  multiple end-customers.

Both use cases emphasize the segregation of different customer data on the same
physical Data Domain system.
Terminology used in Secure Multi-Tenancy (SMT)

Understanding the terminology that is used in SMT will help you better understand this unique environment.

**MTrees**

*MTrees* are logical partitions of the file system and offer the highest degree of management granularity, meaning users can perform operations on a specific MTree without affecting the entire file system. MTrees are assigned to Tenant Units and contain that Tenant Unit's individualized settings for managing and monitoring SMT.

**Multi-Tenancy**

*Multi-Tenancy* refers to the hosting of an IT infrastructure by an internal IT department, or an external service provider, for more than one consumer/workload (business unit/department/Tenant) simultaneously. Data Domain SMT enables *Data Protection-as-a-Service*.

**RBAC (role-based access control)**

*RBAC* offers multiple roles with different privilege levels, which combine to provide the administrative isolation on a multi-tenant Data Domain system. (The next section will define these roles.)

**Storage Unit**

A *Storage Unit* is an MTree configured for the DD Boost protocol. Data isolation is achieved by creating a Storage Unit and assigning it to a DD Boost user. The DD Boost protocol permits access only to Storage Units assigned to DD Boost users connected to the Data Domain system.

**Tenant**

A *Tenant* is a consumer (business unit/department/customer) who maintains a persistent presence in a hosted environment.

**Tenant Self-Service**

*Tenant Self-Service* is a method of letting a Tenant log in to a Data Domain system to perform some basic services (add, edit, or delete local users, NIS groups, and/or AD groups). This reduces the bottleneck of always having to go through an administrator for these basic tasks. The Tenant can access only their assigned Tenant Units. Tenant Users and Tenant Admins will, of course, have different privileges.

**Tenant Unit**

A *Tenant Unit* is the partition of a Data Domain system that serves as the unit of administrative isolation between Tenants. Tenant units that are assigned to a tenant can be on the same or different Data Domain systems and are secured and logically isolated from each other, which ensures security and isolation of the control path when running multiple Tenants simultaneously on the shared infrastructure. Tenant Units can contain one or more *MTrees*, which hold all configuration elements that are needed in a multi-tenancy setup. Users, management-groups, notification-groups, and other configuration elements are part of a Tenant Unit.

Understanding RBAC in SMT

In SMT (Secure Multi-Tenancy), permission to perform a task depends on the role that is assigned to a user. DD Management Center uses RBAC (role-based access control) to control these permissions.

All DD Management Center users can:

- View all Tenants
Create, read, update, or delete Tenant Units belonging to any Tenant if the user is an administrator on the Data Domain system hosting the Tenant Unit

Assign and unassign Tenant Units to and from a Tenant if the user is an administrator on the Data Domain system hosting the Tenant Unit

View Tenant Units belonging to any Tenant if the user has any assigned role on the Data Domain system hosting the Tenant Unit

To perform more advanced tasks depends on the role of the user, as follows:

admin role
A user with an admin role can perform all administrative operations on a Data Domain system. An admin can also perform all SMT administrative operations on a Data Domain system, including setting up SMT, assigning SMT user roles, enabling Tenant self-service mode, creating a Tenant, and so on. In the context of SMT, the admin is typically referred to as the landlord. In DD OS, the role is known as the sysadmin.

To have permission to edit or delete a Tenant, you must be both a DD Management Center admin and a DD OS sysadmin on all Data Domain systems that are associated with the Tenant Units of that Tenant. If the Tenant does not have any Tenant Units, you need only to be a DD Management Center admin to edit or delete that Tenant.

limited-admin role
A user with a limited-admin role can perform all administrative operations on a Data Domain system as the admin. However, users with the limited-admin role cannot delete or destroy MTrees. In DD OS, there is an equivalent limited-admin role.

tenant-admin role
A user with a tenant-admin role can perform certain tasks only when tenant self-service mode is enabled for a specific Tenant Unit. Responsibilities include scheduling and running a backup application for the Tenant and monitoring resources and statistics within the assigned Tenant Unit. The tenant-admin can view audit logs, but RBAC ensures that only audit logs from the Tenant Unit(s) belonging to the tenant-admin are accessible. In addition, tenant-admins ensure administrative separation when Tenant self-service mode is enabled. In the context of SMT, the tenant-admin is usually referred to as the backup admin.

tenant-user role
A user with a tenant-user role can monitor the performance and usage of SMT components only on Tenant Unit(s) assigned to them and only when Tenant self-service is enabled, but a user with this role cannot view audit logs for their assigned Tenant Units. In addition, tenant-users may run the show and list commands.

none role
A user with a role of none is not allowed to perform any operations on a Data Domain system other than changing their password and accessing data using DD Boost. However, after SMT is enabled, the admin can select a user with a none role from the Data Domain system and assign them an SMT-specific role of tenant-admin or tenant-user. Then, that user can perform operations on SMT management objects.

management groups
BSPs (backup service providers) can use management groups defined in a single, external AD (active directory) or NIS (network information service) to simplify managing user roles on Tenant Units. Each BSP Tenant may be a separate, external company and may use a name-service such as AD or NIS.

With SMT management groups, the AD and NIS servers are set up and configured by the admin in the same way as SMT local users. The admin can ask their AD or NIS administrator to create and populate the group. The admin then assigns an SMT role
to the entire group. Any user within the group who logs in to the Data Domain system is logged in with the role that is assigned to the group.

When users leave or join a Tenant company, they can be removed or added to the group by the AD or NIS administrator. It is not necessary to modify the RBAC configuration on a Data Domain system when users who are part of the group are added or removed.

**Tenant and Tenant Unit permission table**

Permissions for working with Tenants and Tenant Units depend on the role of the user in both DD Management Center and the Data Domain system (DD OS).

**Table 11** Permission table for tenants and tenant units, DD Management Center admin and limit-admin

a. For DDMC users, only aggregate/show the Tenant’s Tenant Units on DD system for which the DDMC user has a DD OS role (sysadmin, limited-admin, user or backup operator)
b. For DDMC users, only aggregate/show the Tenant’s Tenant Units on DD system for which the DDMC user has a DD OS role (sysadmin, limited-admin, user or backup operator)
c. For DDMC users, only aggregate/show the Tenant’s Tenant Units on DD system for which the DDMC user has a DD OS role (sysadmin, limited-admin, user or backup operator)

**Use cases for SMT**

The following use cases summarize how SMT (Secure Multi-Tenancy) can be deployed in protection storage infrastructures.

**Local backup**
In a local backup use case, a protection storage infrastructure is shared across clients, and deployment is local to the enterprise. The on-premise IT staff uses each Tenant Unit to back up the data of a specific business unit.

**Replicated backup**
In a replicated backup use case, the tenant performs local backups at their physical site, but does not want to own or manage a remote site for disaster recovery.
purposes. For this type of tenant, service providers can host multiple tenants, each replicating to their own Tenant Unit, to provide replicated backup services on a shared Data Domain backup appliance platform.

Remote backup
In a remote backup use case, a client does not perform local backups at the physical site. Instead, the client performs direct backups over the WAN to a hosted backup IT environment managed by a service provider or a hosted provider. Remote backup is used for traditional client-based backup and application-direct backup.

Multi-User DD Boost and Storage Units in SMT

When using Multi-User DD Boost with SMT (Secure Multi-Tenancy), user permissions are set by Storage Unit ownership.

Multi-User DD Boost refers to the use of multiple DD Boost user credentials for DD Boost Access Control, in which each user has a separate username and password.

A Storage Unit is an MTree configured for the DD Boost protocol. A user can be associated with, or “own,” one or more Storage Units. Storage Units that are owned by one user cannot be owned by another user. Therefore, only the user owning the Storage Unit can access the Storage Unit for any type of data access, such as backup/restore. The number of DD Boost user names cannot exceed the maximum number of MTrees. (See the “MTrees” chapter in this book for the current maximum number of MTrees for each DD model.) Storage Units that are associated with SMT must have the none role assigned to them.

Each backup application must authenticate using its DD Boost username and password. After authentication, DD Boost verifies the authenticated credentials to confirm ownership of the Storage Unit. The backup application is granted access to the Storage Unit only if the user credentials presented by the backup application match the user names associated with the Storage Unit. If user credentials and user names do not match, the job fails with a permission error.

Managing Tenant users and their privileges

There is no direct way to create a Tenant user. The only way for a Tenant to have users is by association with its Tenant Units. Tenant users are all users in their own Tenant Units.

Adding a user with an association to DD Boost data access or Tenant self-service using the CLI can be dangerous because of cross-tenancy issues. The CLI will not validate users belonging to other Tenants when adding DD Boost data access users or Tenant self-service users to the current Tenant.

You can create local users with DD Management Center. If you create a local user with a role of none using the DD System Manager or DD OS CLI, the user will appear in the DD Management Center list of available users to be added for DD Boost data access and/or Tenant self-service.

For more information about creating a user with DD System Manager, see the Data Domain Operating System Administration Guide. For creating a user with the DD OS CLI, see the Data Domain Operating System Command Reference Guide.
Using DD Management Center to administer SMT

In DD Management Center, SMT (Secure Multi-Tenancy) is administered by selecting **Administration > Multitenancy**. SMT is supported on DD VE 3.0 and later.

**Controls**

In the upper-left are controls to Add (green +), Edit (yellow pencil), and Delete (red X) Tenants and/or Tenant Units (depending on what is highlighted in the tree), as well as a Tenant (Unit) Details (blue i) icon that displays the Tenant (Unit) Details Lightbox (depending on what is highlighted). You can also right-click each node in the tree to perform these functions. RBAC (role-based access control) controls all of these actions.

**All Tenants tree**

Below the controls is the Tenant tree, from which you can create and manage Tenants, Tenant Units, and provisioned storage.

The All Tenants node is always displayed and lets you create Tenant objects.

Each node has a control to its left, indicating its Warning or Offline status. This status rolls up to the Tenant and All Tenant nodes. Additionally, controls for creating, editing, or deleting states are displayed while each operation is in progress. Some actions may not be allowed, depending on the different state or status of the nodes. If there are Tenant Units under a Tenant with the same name, an information icon is displayed for the Tenant node.

The Unmanaged node is displayed only if there are unmanaged Tenant Units available. The only actions that are allowed on the Unmanaged node and Unmanaged Tenant Units are Add all to Tenant and Add to Tenant, respectively, and these actions are available only through the right-click context menus.

The user can click on "Unmanaged", and then, in the right pane can select all tenant-units or single/multiple tenant-unit(s) to add to Tenant. The user then clicks the link "Add to Tenant" to add selected tenant-unit(s) to tenant.

**Summary area**

At the right is a summary.

When All Tenants is selected, the summary shows the total number of Tenants, Tenant Units, and host systems. You can see if any of the Tenants or Tenant Units are offline or have configuration problems in different severity panels. You can also see the number of unassigned Tenant Units.

When you select a Tenant or Tenant Unit, the summary includes (depending on the item) the name, status, administrator name and email, host systems, data center location, alerts, and MT tree and storage information, DD Boost Users, Tenant Self-Service information, and Report schedule and recipients.

**Configuration problems**

Tenants can be configured directly on Data Domain systems. This may lead to Tenant name and ID conflicts when these Data Domain systems are managed by DD Management Center. DD Management Center lets you resolve Tenant conflicts by either consolidating the Tenants into one or separating the Tenants with unique names and IDs.

**Note**

Tenants cannot be edited or resolved if any of the Data Domain systems are in an offline state or cannot be reached over the network.
Generating reports, looking at health, changing locations
To generate reports about Tenants or individual Tenant Units, select Reports > Management.
To see the general health for Tenants and Tenant Units, select Health > Status, Health > Alerts, and/or Health > Jobs.
To change a Data Center Location, select Administration > Properties and edit the Data Center property. Each Data Domain system must be explicitly assigned a value for Data Center in Administration > Systems. If a Data Domain system has a Data Center property that is assigned, it is grouped under All in the Create Tenant Unit wizard.

Storage administrator tasks in SMT
Storage administrators are the landlords for backup operators (tenants), in an SMT (Secure Multi-Tenancy) environment. Storage administrators install and configure Data Domain system hardware and software and use DD Management Center to provision and assign storage to the Tenants that they support.
Storage administrators in an SMT environment perform the following tasks:
• Migrate users from multiple small Data Domain systems to one or more larger systems
• Isolate each Tenant’s data from other Tenants who share storage on the same physical Data Domain system
• Monitor and manage the space usage and performance of each system
• Monitor and manage the space usage by and the performance that is provided to each Tenant, which ensures that the storage administrator meets the requirements of the service level agreement with each Tenant
• Grouped Tenants with similar characteristics on the same physical system to gain more cross deduplication
• Charge Tenants based on their space usage

Backup operator tasks in SMT
Backup operators are the tenants in an SMT (Secure Multi-Tenancy) environment. Backup operators are responsible for scheduling and managing backups and replication for their organization or department using the storage available in their Tenant Units.
Backup operators in an SMT environment perform the following tasks:
• Monitor the performance and resources of their Tenant Units
• Monitor replication
• Generate reports
Creating and managing Tenants

DD Management Center provides many options for creating and managing Tenants.

Creating Tenants

You can create Tenants from the Multi-Tenancy page.

Procedure

1. Select Administration > Multi-Tenancy.
2. Highlight All Tenants in the tree, and select Add Tenant (green plus sign) above the tree.
3. In the Create Tenant dialog box, type the following information:
   - For Tenant name [which is required, as indicated by the asterisk (*)], you can use the name of the client or organization that will use the storage. For example, if you are a service provider, the name might be XYZ Widget Corp. If you are a storage administrator for an organization, the name might be Finance Department.
   - For Administrator name (which is optional), type the name of the backup administrator.
   - For Administrator email [which is required, as indicated by the asterisk (*)], type the email address of the backup administrator. This information is used to create a default Alert Notification list.
4. Select Create.

Results

The new Tenant appears in the tree.

Viewing Tenant information and status

You can view information about all Tenants or individual Tenants from the Multi-Tenancy page.

Procedure

1. Select Administration > Multi-Tenancy.
2. Highlight All Tenants to see an overview of the configured Tenants, important messages, and the status of multitenant reporting.
3. Highlight a specific Tenant to see the backup administrator's name and email address, important messages about the Tenant Units for this Tenant, and information about reports for this Tenant.
4. For much more detail about the Tenant, select Tenant Details (the blue i), above the list of Tenants, to see all of the available information about the Tenant. The Tenant Details lightbox is described in the next section.

Tenant Details lightbox

The Tenant Details lightbox provides detailed operating information about a specific Tenant.

The Tenant Details lightbox is accessed from the Administration > Multi-Tenancy, using the Tenant Details control.
The **Overview** page has the following sections:

- **Tenant**, which includes Tenant name, Administrator, Administrator email, Tenant Units, and Systems.
- **Health**, which includes four LEDs for Alerts, File Systems, DD Boost, and Replication. These alerts can be in a Normal, Warning, or Error state. You can hover over an alert to get more information. The Tooltip on the LEDs lists the Tenant Units that have problems, along with a link to launch the related DD system for that Tenant Unit. Health LEDs can also be in a disabled state if the underlying component (that is, Replication, DD Boost, and so forth) is either not licensed or disabled on any of the DD systems of the Tenant.
- **Capacity**, which includes a capacity meter that shows the current utilization, aggregate values for quota available, quota used, quota used % (based on all configured MTrees owned by the Tenant), and a warning/error banner, if any of the quotas has not been enabled or configured.
- **Replication**, which includes counts for both automatic and on-demand replication pairs: total, with errors, and with unknown status.
- **Network Bytes Used**, which includes the total, backup, and restore replication bytes used.

The **Capacity** page shows Capacity Overview details with a variable meter that shows the quota (available, used, and used percentage). The Logical Space Usage chart shows plots for Pre-comp used for a selected period of time (24 Hours, 7 Days, 30 Days, 90 Days, or Custom – to set your own time period). There is also a list of Tenant Units that are associated with this Tenant with their MTrees or Storage Units, including a severity panel with any warnings for the MTree/Storage Unit selected.

The **Replication** page shows Replication Overview details that include the total number of bytes replicated for Automatic Replication Pairs and On-Demand Replication Pairs. The Replication Trend chart shows plots for Pre-comp replicated, Post-comp replicated, and/or Compression ratio plots for a selected period of time (24 Hours, 7 Days, 30 Days, 90 Days, or Custom – to set your own time period).

The **Network** page shows Network Overview details that include the last 24 hours of back-up, restored data, and total inbound and outbound replication. The Trend Analysis charts show plots for Total Network Used, Backup and Restore Bytes Used, and Replication Bytes Used for a selected period of time (24 Hours, 7 Days, 30 Days, 90 Days, or Custom – to set your own time period).

The **System Charts** page shows the system charts for the DD system of a selected Tenant Unit that is associated with this Tenant. Desired charts can be added to the chart area (at the right) by enabling the respective checkboxes. You can display Resource charts for CPU utilization and Network throughput; File system charts for Stream counts, Protocol processing, and Protocol throughput. Replication charts for Inbound/Outbound characteristics and Throughput for each type of replication. In the chart area, multiple charts are displayed vertically according to the selection. All of these charts can be displayed for a selected period of time (24 Hours, 7 Days, 30 Days, 90 Days, or Custom – to set your own time period).

### Editing Tenant information

You can change Tenant names, administrator names, and administrator email addresses using the Edit Tenant dialog.

You may need to **Resolve Tenant Conflicts** If you are managing Tenants from both DD Management Center and the DD OS CLI. Tenants have two identifiers: their name and a Universally Unique ID (UUID). From the DD OS CLI (starting in 5.7), you can easily create two Tenants with the same name but different UUIDs. DD Management Center
will detect this and offer to either merge the two Tenants (by giving them a newly created UUID) or rename one of the Tenants. When done, no Tenants will share a name without also sharing a UUID (and vice versa).

If you change the name of a Tenant that is part of a PCM schedule, the name change is not updated automatically in the schedule. You must manually add the new Tenant name to the PCM schedule.

**Procedure**

1. Select Administration > Multi-Tenancy.
2. In the tree, highlight the Tenant that you want to update, and select Edit Tenant (yellow pencil) above the tree.
3. In the Edit Tenant dialog, edit what you need to change, and select **Save**.

**Results**
The edited Tenant will again be displayed in the tree.

### Deleting Tenants

When you no longer need to provide storage for an organization, you can delete the Tenant that corresponds to that organization.

**Procedure**

1. Select Administration > Multi-Tenancy.
2. Highlight the Tenant in the tree, and select Delete Tenant (red X) above the tree.
3. In the Delete Tenant dialog box, you have two options:
   - **Remove all Tenant Units**, which will preserve the data, so that the Tenant Unit may be assigned to another Tenant. The Tenant Units will be moved to the Unmanaged Tenant Unit pool and will retain all MTrees/Storage Units associated with them.
   - **Destroy all Tenant Units**, which will destroy all of the Tenant Units and any MTrees and Storage Units associated with them.
4. Select **Yes**.

**NOTICE**
Deleting a Tenant cannot be undone from DD Management Center, so be very careful when performing this task.

**Results**
The Tenant has been deleted from the tree.

**What to do if delete Tenant fails**
When you try to delete a Tenant, the operation may fail for a variety of reasons.

First, go to the **Health > Jobs** page, select the failed job, and observe the reason for the failure, which may include:

- The file system of one or more of the Data Domain systems under the Tenant is turned off.
- Some of the Data Domain systems under the Tenant are not reachable or are powered off.
The DD Boost feature of one or more of the Data Domain systems under the Tenant is disabled or is not licensed.

You can manually fix these problems using both the DD System Manager and the DD Management Center command line interfaces (you need to fix them in both places, as they are Data Domain system-related). Then, you can try to delete the Tenant again using DD Management Center.

Creating and managing Tenant Units

DD Management Center provides many options for creating and managing Tenant Units.

Creating a Tenant Unit with the wizard

You can create a Tenant Unit with the Create Tenant Unit Wizard.

Before you begin

Storage for a Tenant is contained within a virtual partition that is called a Tenant Unit on a DD system. To assign storage to a Tenant, you can use the Create Tenant Unit Wizard to create the Tenant Unit, provision storage, and assign the Tenant Unit to a Tenant. You can also create an empty Tenant Unit for a Tenant and provision storage later.

Select Administration > Multi-Tenancy. Then select a Tenant, and the Add (green +) control.

You have three choices when creating a Tenant Unit:

- **Create a Tenant Unit with manual provisioning**, where you create/select the MTrees and Storage Units that are associated with this Tenant Unit. You can also optionally create DD Boost Data Access users to go with the Storage Units.

- **Create a Tenant Unit with automatic provisioning**, where you can add new or existing DD Boost Data Access users to this Tenant Unit. This allows backup software to create Storage Units that are assigned to this Tenant Unit.

- **Create an empty Tenant Unit**, where you can provision the Tenant Unit later using the Edit Tenant Unit dialog box.

Procedure

1. On the first page of the wizard, Identify Host System:
   - For Datacenter location (which is optional), select a location. These locations (for example: Dallas, New York) must have been entered previously as Data Center location properties. (Administration > Properties > Data Center).
   - For Size now (GiB) (which is optional), type a number to filter systems that do not currently have sufficient storage capacity.
   - For Size to grow (GiB) (which is optional), type a number to filter systems that will not have sufficient capacity at a specified time in the future (set in the next field, “Time to grow”), based on capacity projections. The size to grow is actually the size to grow to by the specified time. For example, for a specified time of 6 months, if the size now is 1 GiB, and the size to grow is 2 GiB, in 6 months, the minimum capacity requirement would be 2 GiB.
   - For Time to grow (which is optional), type the time after which the “Size to grow” amount of capacity should be reached.
2. On the second page of the wizard, Select Host System, you see systems that have enough logical capacity to host the Tenant Unit:

**How do I check host system performance?** Use the following information to determine the best system on which to create the Tenant Unit.

- **Available now** indicates systems that you can select now.
- **Available in 6 months** is displayed if you selected 6 months in the “Time to grow” field on the previous page, or did not explicitly select a value. **Available in 12 months**, **Available in 18 months**, or **Available in 24 months** is displayed if you selected those values in “Time to grow”. For example, for a specified time of 6 months, if the size now is 1 GiB, and the size to grow is 2 GiB, in 6 months, the minimum capacity requirement would be 2 GiB. Any system that has a lower projected capacity is filtered from the list. Also, any system offline at the time, as well as any collection destination system, is filtered from the list. Also, any systems running a version prior to DD OS 5.6 are filtered from the list, that is, only systems running DD OS 5.6 or later are listed.
- **Existing Tenant Units** displays the current number of Tenant Units on this system.
- For systems with an information (blue i) control, you can hover to see a warning message explaining why a projection cannot be made.
- If a DD system is not listed, it may be because it:
  - is not in the specified data center.
  - is offline.
  - is running DD OS 5.6 or earlier.
  - has insufficient capacity.
  - has a replication destination.
  - is a system for which you do not have administrative privileges.
- For the selected system, the charts at the bottom show historical data, including **Throughput** for the selected connection Port, **CPU** utilization for each system, and **Stream Count**. You may toggle the Port and the time (Last 7 days, Last 30 days, or Last 90 days) drop-down menus to get different sets of data.

3. On the third page of the wizard, Administration, type name and administrator details:

- For **Tenant Unit name** [which is required, as indicated with the asterisk (*)], type a unique Tenant Unit name per system.
- For **Administrator name** (which is optional), type the name of the backup administrator.
- For **Administrator email** [which is required, as indicated with the asterisk (*)], type the email address of the backup administrator. This is used to create a default Alert Notification list.
- When **Create an Empty Tenant Unit** is selected, **Use strict security mode** options will now show.
- Check **Use strict security mode** if you want to allow incoming replications only if they are from another Tenant Unit that is owned by the same Tenant.
- Select or type **Management IP Addresses** (which is optional), as needed.
4. The fourth page of the wizard depends on the previous choice. [Note that for “Create an empty Tenant Unit”, you will go to the final page (step 5).]

a. For manual provisioning, you can create MTrees/Storage Units.

- MTrees/Storage Units can be added here, when creating a Tenant Unit with Manual Provisioning. You can also add them when editing a Tenant Unit.
- You can add new MTrees or Storage Units, or select from the Existing MTrees or Storage Units on the host system.
- You can also edit, unassign, or destroy MTrees or Storage Units from the same area.
- If an MTree or Storage Unit selection is disallowed, you can hover the mouse over it, to see more information.

b. For automatic provisioning, you can configure users for data access over the DD Boost protocol.

- You can add an existing local user or create a new local user and promote the local user to DD Boost user.
- You can delete the selected DD Boost User.
- The table contains DD Boost Data Access User names and the Storage Units count associated with the user.
- The information panel shows when one or more users are selected.
- The configuration is not changed until you select Create on the Summary page.
- If there are one or more local users in the list, the first local user in the list is selected by default. If there are no local users in the list, the “New local user” is selected. All selected users or newly created users will automatically be default Tenant Units.
- A warning shows if the current selected local user already has another Tenant Unit as their default Tenant Unit.
- The first entry in the “Local user” drop-down list is “New local user”, which lets you create a new local user and add it as a DD Boost Data Access user.
- When selecting “New local user”, the Add Data Access User dialog box changes to a Add New Data Access User form.

5. The fifth (final) page (fourth page for “Create an empty Tenant Unit”) of the wizard is a Summary, showing data from the previous pages.

- The Tenant Unit is not created until you select Create.
- You have the option to send an email to the Tenant Unit administrator on the successful creation of the Tenant Unit.
- Creating a Tenant Unit with any sort of provisioning (not empty) automatically generates a pair of Report Templates (Status and Usage) and schedule them.
You may get one of two warnings: (1) You have not provisioned this Tenant Unit correctly. Add MTrees or Storage. (2) You have not provisioned this Tenant Unit correctly. Make this Tenant Unit the Default Tenant Unit for one of the DD Boost Data Access Users.

Results
The newly created Tenant Unit is added to the tree.

What to do if create Tenant Unit fails
Creating a Tenant Unit may fail for a number of reasons.

It may fail for simple reasons such as a duplicate Tenant Unit name, or it may fail if there are sudden system state changes, such as a network/connectivity issue.

Within the create process itself, there may be failures where MTrees or Storage Units may fail to get created for one or more reasons, or DD Boost users may not get created.

Creating a Tenant Unit will succeed even if the configuration of an individual component like MTrees or DD Boost users fails. So, the final components of a newly created Tenant Unit might not match the specifications.

To see the success and/or failed information for each task, or if there is an inconsistency in what you expected and what was created, select Health > Jobs to see additional messages.

You must address the reasons for failure before trying to re-create a new Tenant Unit, or you risk seeing the same failure situations again.

Security mode and management IP addresses

*Strict Security Mode* assures that incoming replication is from another Tenant Unit owned by the same Tenant. In addition, this mode must be enabled to allow management connections to or from assigned IPs. *Management IP addresses* let you associate a Tenant Unit with certain IP addresses for both remote clients and other local DD Management Center systems.

- *Remote client addresses* are IP addresses from which incoming connections will be accepted. These addresses must be IPv4 or IPv6.
- *Local DD Management Center addresses* are IP addresses that are available to connect to and manage this Tenant Unit. You can enter new addresses that will be configured on the Data Domain system. Or you can select from configured IPv4 or IPv6 addresses on the Data Domain system that are not assigned to other Tenant Units. (Assigned IP addresses are grayed out and cannot be selected.)

Viewing Tenant Unit information and status
You can view information about all Tenant Units from the Multi-Tenancy page.

**Procedure**
1. Select Administration > Multi-Tenancy.
2. Select a Tenant Unit in the tree to view a summary page and critical alerts.
3. For more detail about the Tenant Unit, select Tenant Unit Details (the blue i), above the tree, to see all of the available information about the Tenant Unit. The *Tenant Unit Details lightbox* is described in the next section.
Tenant Unit Details lightbox

The Tenant Unit Details lightbox provides detailed operating information about a specific Tenant Unit.

The Tenant Unit Details lightbox can be accessed from the Administration > Multi-Tenancy, Health > Status, or Health > Alerts page (Tenants View), using the Tenant Unit Details control.

The Overview page has the following sections:

- **Tenant Unit**, which includes Tenant Unit name, Administrator, Administrator email, Host System, and Data Center Location.
- **Health**, which includes four LEDs for Alerts, File Systems, DD Boost, and Replication. These alerts can be in a Normal, Warning, or Error state. You can hover over an alert to get more information. Health LEDs can also be in a disabled state if the underlying component (that is, Replication, DD Boost, and so forth) is either not licensed or disabled for the DD system of the selected Tenant Unit.
- **Host System Performance Details**, which shows data flow for Throughput, CPU and Stream Count. Different network ports can be selected. Chart durations can be selected among: Last 24 Hours, 7 Days, 30 Days, 90 Days, and Custom.
- **Capacity**, which includes a capacity meter that shows the current utilization, aggregate values for quota available, quota used, quota used % (based on all configured MTrees owned by the Tenant Unit), and a warning/error banner, if any of the quotas has not been enabled or configured.
- **Replication**, which includes counts (inbound and outbound) for both automatic and on-demand replication pairs: total, with errors, and with unknown status.
- **Network Bytes Used**, which includes the total, backup, and restore replication bytes used.

The Capacity page shows Capacity Overview details with a variable meter that shows the quota used percentage; a Logical Space Usage chart that can be scaled to view certain periods of usage; and a list of Tenant Units with their MTrees or Storage Units, including a severity panel with any warnings for the MTree/Storage Unit selected.

The Replication page shows Replication Overview details that include the total number of bytes replicated for Automatic Replication Pairs and On-Demand Replication Pairs. The Replication Trend chart shows at least one of: Pre-comp replicated, Post-comp replicated, and Compression ratio plots in a customized time plot.

The Network page shows Network Overview details that include the last 24 hours of back-up, restored data, and total inbound and outbound replication. The Trend Analysis shows charts that can be viewed for a certain period by selecting one of the four options (24 Hours, 7 Days, 30 Days, 90 Days) or by selecting Custom, which lets you select a different time frame.

The System Charts page shows the system charts for the DD system of the selected Tenant Unit. Desired charts can be added to the chart area (at the right) by enabling the respective checkboxes. You can display Resource charts for CPU utilization and Network throughput. File system charts for Stream counts, Protocol processing, and Protocol throughput; Replication charts for Inbound/Outbound characteristics and Throughput for each type of replication. In the chart area, multiple charts are displayed vertically according to the selection.
Editing Tenant Unit information

You can change all types of information for both managed and unmanaged Tenant Units using the Edit Tenant Unit dialog.

Procedure
1. Select Administration > Multitenancy.
2. Highlight the Tenant Unit in the tree, and select Edit Tenant Unit (yellow pencil) above the tree.
3. The Edit Tenant Unit dialog has the following tabs: General, Alert Notifications, DDBoost Data Access Users, MTrees, and Tenant Self-Service, which are described in the following sections.

Editing Tenant Units: General tab

You can change administrative information for both managed and unmanaged Tenant Units using the General tab in the Edit Tenant Unit dialog.

Procedure
1. Select Administration > Multitenancy.
2. Highlight a Tenant Unit in the tree, and select Edit Tenant Unit (yellow pencil) above the tree.
3. In the General tab, you can change the following:
   - Tenant Unit name
   - Administrator name
   - Administrator email – If the administrator email is modified, report templates sending reports associated with the Tenant Unit to that administrator need to be re-routed. After editing the administrator email, a popup appears confirming whether a change needs to be made for all report templates associated with the old email. If you select Yes, all old administrator emails will be replaced with the new value.
   - Security Mode – You can choose to enable strict security mode, which assures that any incoming replication is from another Tenant Unit owned by the same Tenant. In addition, this mode must be enabled to allow management connections to or from assigned IPs.
   - Management IP Addresses – You can add or delete management IP addresses for remote client addresses and/or local DD Management Center addresses.

Editing Tenant Units: Alert Notifications tab

Each Tenant Unit has a default alert notification list (created by the Data Domain system) containing the administrator email. You can create new alert notification lists, edit existing lists, or delete lists associated with the Tenant Unit, using the Alert Notifications tab in the Edit Tenant Unit dialog.

Procedure
1. Select Administration > Multitenancy.
2. Highlight a Tenant Unit in the tree, and select Edit Tenant Unit (yellow pencil) above the tree.
3. In the Alert Notifications tab, select Add (green plus sign).
4. In the Add Alert Notification Group dialog, enter a name for the notification group.
5. Select Add (green plus sign), and enter the first email address. Optionally, continue selecting Add to enter more addresses.
6. Select Add at the bottom of the dialog when you have finished adding addresses, and then select OK or Apply to save your changes.

Editing Tenant Units: Data Access Users tab

Data Access Users are users that are configured for specific Tenant Units (one or more user per Tenant Unit). You can optionally designate a Tenant Unit as the default Storage Unit for a Data Access User. When your backup software creates new Storage Units for a user, the software automatically uses the default Tenant Unit.

Procedure
1. Select Administration > Multitenancy.
2. Highlight a Tenant Unit in the tree, and select Edit Tenant Unit (yellow pencil) above the tree.
3. In the Data Access Users tab, add, edit, or delete users, as desired. New Data Access users are assigned the role of none. If a user has already been created with a role other than none, that user is disabled and can only be deleted from the table. Also, if a user has already been associated with multiple Tenants, that user is disabled and can only be deleted from the table. Password validation for a new local user is based on the DD OS password policy strength associated with the current Tenant Unit.
4. The columns indicate:
   - MTrees Accessed - The combined total of Storage Units and vDisk Pools.
   - MTREE Type - Supported types are Storage Unit and vDisk Pool. If a user is not associated with an MTree's access, the MTree type will be None.
5. Select OK or Apply to save your changes.

Fixing a Double Agent issue

Double Agent data access users are users associated with more than one tenant.

If a local user owns multiple Storage Units, and the Tenant Units that contain those Storage Units do not all belong to the same Tenant, this is definitely a misconfiguration and always results in a security breach (either data or administrative isolation is violated). This situation can also result in Tenant usage report errors. The effects of the misconfiguration depend on which Tenants actually own the data in the affected Storage Units. If the data in all of these Storage Units is actually owned by a single Tenant, then there is no data isolation security breach (each Tenant can access only their own data), but the usage reports for the Tenants will be incorrect. Some Tenants will see usage for Storage Units that belong to other Tenants, and some Tenants will not see usage for some of their Storage Units. In addition, some Tenants will be able to view the Storage Unit names and usage of other Tenant's Storage Units. So this is also an administrative isolation security breach.

If some Storage Units contain data for one Tenant, and other Storage Units contain data for a different Tenant, then different Tenants have been given the same user credentials to access their Storage Units, so there is a data isolation security breach, since each Tenant can access the other Tenant's data in the Storage Units owned by
the shared local user. However the usage reports for each Tenant will be correct in this case.

Fixing a user not "none" issue

Data access users must always have the role of none.

A user who does not have a role of none is already associated with a Tenant. Thus, the user credentials (user/password) of a user who has permission to view and possibly even change the configuration/data on the Data Domain system have been given to a Tenant. If the user has the admin role, for example, the Tenant can now access (read/write) any other Tenant's data, and view/change any Data Domain system configuration.

This security breach is present whether this (non-none role) user is associated with just one Tenant, or multiple, different Tenants. The main security breach is not that one user is used by multiple Tenants; it is that a user given to a Tenant for use can view and/or modify configuration and data that does not belong to the Tenant.

To prevent security breaches, data access users must always have a role of none. In some customer configurations where Tenants are considered trustworthy, Tenants may have some non-none role users, but the best security practice is to not allow this.

Fixing a user not "none" and a Double Agent issue

You may sometimes have cases in which a data access user both does not have the role of none and is a Double Agent user, which is a user associated with more than one Tenant. You must resolve both of these issues before continuing.

A user who does not have a role of none is already associated with a Tenant. Thus, the user credentials (user/password) of a user who has permission to view and possibly even change the configuration/data on the Data Domain system have been given to a Tenant. If the user has the admin role, for example, the Tenant can now access (read/write) any other Tenant's data, and view/change any Data Domain system configuration. (See the previous section, Fixing a user not "none" issue on page 106, for more on this problem.)

A Double Agent user may own multiple Storage Units, but the Tenant Units that contain those Storage Units do not all belong to the same Tenant. This is definitely a misconfiguration and always results in a security breach (either data or administrative isolation is violated). This situation can also result in Tenant usage report errors. (See the previous section, Fixing a Double Agent issue on page 105, for more on this problem.)

Editing Tenant Units: DD Boost Streams tab

You can limit the number of streams an application can use when reading or writing data to a Storage Unit. If a client uses more than the set limit, an alert will be generated by the Data Domain system.

Procedure

1. Select Administration > Multitenancy.
2. Highlight a Tenant Unit in the tree, and select Edit Tenant Unit (yellow pencil) above the tree.
3. In the DD Boost Streams tab, view the Storage Units associated with this Tenant Unit.
4. If you want to set limits for a Storage Unit, select that unit, and then select Set Limits.
Configuring DD Boost stream limits

You can configure stream warning limits for each Storage Unit for four items: Read, Write, Replication, and Combined. When any of these stream counts exceeds the warning limit, an alert is generated.

Procedure

1. Select Set Limits from the DDBoost Streams tab of the Edit Tenant Unit dialog [which you can get to by selecting Administration > Multi-Tenancy, then selecting a Tenant Unit and Edit Tenant Unit (yellow pencil)].

2. In the Set DDBoost Stream Limits dialog, enter values for the Read, Write, Replication, and Combined stream limits. Do not exceed the DD system limits. Also note that a single value cannot be larger than the combined limit.

   **Note**

   For Data Domain systems running DD OS 5.7 or later, the hard stream limit value will be displayed. For Data Domain systems running an earlier DD OS version, these values are not displayed.

   For hard limits there are two additional validation rules:

   - The combined limit is also no greater than the sum of the other hard limits (if it is, you will hit one of the other limits first and never the combined limit).

   - The combined limit is less than the maximum individual hard limit (if it is, you will never hit that individual limit, that is, you will always hit the combined limit first).

3. If the limits are surpassed, an alert will be generated by the Data Domain system.

4. Select Set.

Editing Tenant Units: MTrees tab

You can create and manage MTrees, Storage Units, vDisk Pools, and VTL Pools using the MTrees tab in the Edit Tenant Unit dialog. In addition to this method, you can also add these when you are creating a Tenant Unit with Manual Provisioning.

Procedure

1. Select Administration > Multitenancy.

2. Highlight a Tenant Unit in the tree, and select Edit Tenant Unit (yellow pencil) above the tree.

3. In the MTrees tab, add, edit, or delete MTrees, Storage Units, vDisk Pools, and VTL Pools, as desired.

   **Note**

   vDisks with *double agent* data access users (that is, users associated with another Tenant) or users with a role other than *none* cannot be associated with the Tenant Unit.

4. If capacity quota is enabled on the host system, you may edit soft and hard quotas.
Adjusting soft/hard quotas for MTrees and Storage Units

Quotas can be enabled or disabled on a host system using the command line interface (CLI) or with DD System Manager. You cannot enable or disable quotas using DD Management Center. You can adjust quotas using DD Management Center if the host system quotas have already been enabled.

Before you begin

The host system quotas must have already been enabled.

Procedure

1. Select **Administration** > **Multitenancy**.
2. Highlight the Tenant Unit in the tree, and select Edit Tenant Unit (yellow pencil) above the tree.
3. In the MTrees tab, highlight a Storage Unit or MTree in the list, and select Edit (yellow pencil).
4. Set the desired quota values in the Edit MTree or Edit Storage Unit dialog, and select **Save**.
5. Select **OK** or **Apply** to save your changes.

After you finish

You can also enable or disable quotas on the host system by:

1. Launch the DD System Manager, for the specific Data Domain system, from DD Management Center.
2. Select **Data Management** > **Quota tab**.
3. Enable or disable quotas, as needed.

You can also enable or disable quotas using the CLI. See the *Data Domain Operating System Command Reference Guide*.

Editing Tenant Units: Tenant Self-Service tab

*Tenant Self-Service* is a method of letting a Tenant log in to a Data Domain system to perform some basic services (add, edit, or delete local users, NIS groups, and/or AD groups). This reduces the bottleneck of always having to go through an administrator for these basic tasks. The Tenant can access only their assigned Tenant Units. Tenant Users and Tenant Admins will, of course, have different privileges.

To create a list of users that may have Self-Service access to a particular Tenant Unit:

Procedure

1. Select **Administration** > **Multitenancy**.
2. Highlight a Tenant Unit in the tree, and select Edit Tenant Unit (yellow pencil) above the tree.
3. In the Tenant Self-Service tab, you must first enable Tenant Self-Service, if it disabled (which is it by default).
4. Note that in this table:
   - The **Type** column displays management-user or management-group.
   - The **Group Type** column displays either NIS or Active Directory for groups, and N/A for users.
   - The **Role** column displays tenant-admin or tenant-user.
5. To add a self-service user, select Add (green plus sign). In the Add Self-Service User dialog, select the desired local user, NIS group, or AD group, or create a new local user (there is no default). If you select New local user, the dialog will add fields for Name, Password/Confirm, and Role (tenant-admin or tenant-user). Password validation for a new local user is based on the DD OS password policy strength associated with the current Tenant Unit.

6. To edit a self-service user, select a User or Group, and select Edit (yellow pencil). You can change the Role from tenant-admin to tenant-user, or vice-versa.

7. To delete a self-service user, select a User or Group, and select Delete (X). You will get a confirmation dialog to make sure that you definitely want to delete this user or group. A new Tenant self-service user or group is assigned the role of none. If a user or group has already been created with a role other than none, that user or group is disabled and can only be deleted from the table. Also, if a user or group has already been associated with multiple Tenants, that user or group is disabled and can only be deleted from the table.

Deleting Tenant Units and unassigning provisioned storage

You can delete Tenant Units, and if a Tenant Unit has provisioned storage, you can unassign that storage to be reassigned later to another Tenant Unit, or you can destroy all of the data. Be very careful when performing this task – it cannot be undone.

**Procedure**

1. Select Administration > Multitenancy.
2. Highlight a Tenant Unit in the tree, and select Delete Tenant Unit (red X) above the tree.
3. In the Delete Tenant Unit dialog, if the Tenant Unit has provisioned storage, you have two options:
   - **Unassign all storage**, which retains all MTrees and Storage Units associated with the Tenant Unit, so they can be reassigned later to another Tenant Unit.
   - **Destroy all storage**, which deletes all MTrees and Storage Units associated with the Tenant Unit.
4. Select Yes to delete the Tenant Unit.
5. Observe that the Tenant Unit has been deleted from the tree.

**What to do if delete Tenant Unit fails**

When you try to delete a Tenant Unit, the operation may fail for a variety of reasons.

First, go to the Health > Jobs page, select the failed job, and observe the reason for the failure, which may include:

- The file system of the Data Domain system on which the Tenant Unit resides is turned off.
- The Data Domain system on which the Tenant Unit resides is not reachable or is powered down.
- The DD Boost feature of the Data Domain system on which the Tenant Unit resides is disabled or is not licensed.

You can manually fix these problems using both the DD System Manager and the DD Management Center command line interfaces (you need to fix them in
both places, as they are Data Domain system-related). Then, you can try to delete the Tenant Unit again using DD Management Center.

**Adding an unmanaged Tenant Unit to a Tenant**

Working from the DD OS CLI (command-line interface), administrators can create Tenant Units without adding them to tenants. These Tenant Units are referred to as unmanaged. In DD Management Center, you cannot create an unmanaged Tenant Unit, but you can add an unmanaged Tenant Unit to a tenant.

**Procedure**

1. Select **Administration > Multitenancy**.
2. Select the Unmanaged node in the tree. A table is displayed on the right, which contains all unmanaged Tenant Units and the host systems on which they reside.
3. To add all unmanaged Tenant Units to a Tenant, right-click the Unmanaged node, and select Add all to Tenant. In the Add (All) Tenant Units dialog, select the Tenant name, and select Add.
4. If you want to add only a specific Tenant Unit or Units to a Tenant, go back to the table to select the checkbox or checkboxes next to them. Or to select a single Tenant Unit, and see a summary about it, you can expand the Unmanaged list (if it is not already expanded), and select a single Tenant Unit.
5. At the top right, select the **Add to Tenant** link.
6. In the Add Tenant Unit(s) dialog, select a Tenant name, and select **Add**. The Tenant Unit will be moved from the Unmanaged node to the selected Tenant, in the tree.

**After you finish**

You may encounter a potential conflict when trying to assign a Tenant Unit. Suppose you have a DD Boost user, or Tenant self-service user, configured under a current unmanaged Tenant Unit. If the same user is configured to the managed Tenant Unit of Tenant T2, but you want to assign the Tenant Unit to Tenant T1, this is considered a conflict and is not allowed.

**Creating, editing, and generating SMT reports**

You can create, edit, and generate reports for SMT (Secure Multi-Tenancy) using DD Management Center.

**SMT report permission table**

Permissions for working with creating and viewing reports for Tenants and Tenant Units depend on the role of the user in both DD Management Center and on the DD system (DD OS).

<table>
<thead>
<tr>
<th>DDMC user/DD OS role</th>
<th>DDMC admin/DD OS sysadmin</th>
<th>DDMC limited-admin/DD OS sysadmin</th>

</tr>
</tbody>
</table>

a. DDMC user can view only templates or reports that they created.
b. Only DDMC admin should be allowed to create Tenant report template.
c. DDMC user is not allowed to manually create a Tenant report template.
d. If the reports of a DDMC user are deleted, that user is warned, and the reports are re-created and tagged for that user only.

Creating SMT report templates

SMT (Secure Multi-Tenancy) report templates configure daily status and usage metrics for Tenants and Tenant Units.

**Note**

If a user who is the “owner” of any report templates is deleted from DD Management Center, those report templates will still appear to be owned by the “deleted” user, but the reports will no longer run at their scheduled times.

**Procedure**

1. Select Reports > Management.
2. Select Add (green plus sign).
3. In the Add Report Template dialog box, select Multi-Tenancy Reports and select Next.
4. Type a name, and select a template. The template choices are Daily Status or Usage Metrics. Choose one or more Sections to include, and select Next.
5. Select a Scope (Tenant Unit or Tenant). The Daily Status report is always configured to show the last 24 hours of historical data, and you can select the Report retention (Forever, 7 days, 30 days, 90 days). The Usage Metrics report (which is generated as an Excel spreadsheet) lets you display data for a full month or a full week. Select Edit to set a schedule for the frequency and time the report is run. Report generation time will be two hours ahead of Starts On time.
6. For the Tenant Unit report template, the Tenant Unit admin email messages are added by default. For the Tenant report template, the Tenant admin email is added by default. You can manually add or remove these email messages.
7. Review the details, and select whether to save the template for later use and/or to run the report immediately. Select Finish.

**Results**

After it has been created, a Multi-Tenancy report template is added as an entry in the reports table. When selected, the template can be used to immediately run a report, or it can be edited or deleted, or the time it was last run can be displayed.
Editing SMT report templates

You can reconfigure an SMT report template using the Edit control. The report's content, schedule, and email distribution can be modified in the template.

Procedure

1. Select Reports > Management.
2. Select a template, and select Edit (yellow pencil). In the Edit Report dialog, you can select from three tabs.
3. In the Content tab, the template name can be renamed and template sections can be re-selected for the report. Note that the template, itself, is not editable.
4. In the Scope tab, the template scope and schedule can be changed. The report template can be changed from a Tenant report to a Tenant Unit report or from a Tenant Unit report to a Tenant report. For the daily status report template, the schedule can be changed only to daily time. For the usage report template, the time span can be weekly or monthly. If time span is weekly, only weekly can be scheduled for start on time, and if time span is monthly, only monthly can be scheduled for start on time. Both daily status and usage report templates can modify the report retention period (Forever, 7 days, 30 days, 90 days).
5. In the Email tab, emails can be manually added or removed from the When report is finished list or/and from the If an error occurs list.
6. Select Apply and/or OK.

Generating SMT reports

An SMT report can be generated after the last step of the Create Report wizard or by selecting a report template listed in the Template name table and selecting Run Report.

Schedules may be consolidated on multiple Data Domain systems, as follows:

- If two or more schedules have the same name, type, and schedule (for example, “every Monday at 7 AM”), DD Management Center displays one schedule that is configured on different Data Domain systems.
- If two schedules have the same name, but different types and/or different scheduled times, DD Management Center displays two schedules.
- If a schedule is Disabled on one Data Domain system, but Enabled on another, DD Management Center displays one schedule.

Procedure

1. Select Reports > Management.
2. Select a report template from the list.

Results

A report (named by concatenating the datestamp to the template title) is created and opened as a PDF file in the browser, except for the Tenant Usage report, which is generated as an Excel file.

The report generation information is listed in the Report History table, where it can be viewed, renamed, or deleted.
CHAPTER 7

Performing Additional Configuration

- Managing network settings ................................................................. 116
- Managing access to DD Management Center ........................................ 129
- Managing general configuration settings ............................................. 150
Managing network settings

The Settings page presents status and configuration information for network interfaces, DNS, hosts, SNMP, and routes. Settings can be accessed via the gear icon on the DDMC Banner in the upper right corner. Use this area to configure networking for the DD Management Center.

Configuring network settings

Click the gear icon in the DD Management Center banner to access Settings, then select one of the options under Network.

Viewing network settings

You can view network settings for DD Management Center, while also adding or removing settings.

Procedure

1. Click the Settings button (the gear icon) in the DD Management Center banner, then select one of the options under Network.
2. View the network settings (described in the following table), and use the add, edit, or delete button to change the configuration.

Table 15 Network settings

### Configuring network interfaces

You can modify physical network connections and existing interface configurations for DD Management Center from the **Settings** page.

### Viewing interface information

The Interfaces page (**Settings > Network > Interface tab**) lets you manage and configure the physical (Ethernet) interface, DHCP, DDNS, and IP addresses, and displays network information and status.

There are two parts to this page: the Interfaces area and the Details area. Select an interface and click **Edit** to modify an interface.

### Table 16 Interfaces area

<td>Values are Unknown, 10 Mb/s, 100 Mb/s, 1000 Mb/s, or 10 Gb/s.</td>
</tr>
<tr>
<td>Supported Speeds</td>
<td>Lists all speeds the interface is capable of using.</td>
</tr>
</tbody>
</table>

**Configuring hosts**

Both the host name and domain name are used by other systems when they want to access DD Management Center. The host name can be set manually or automatically generated with DHCP.

Note the following before setting a host or domain name:

- Do not include an underscore in the host name. It is incompatible with some browsers.
- Changing the names of an active host can cause: (1) a break in the current connection – if this happens, log back in, and check the saved settings, and/or (2) disruption of communication with managed DD systems.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DDMC banner, then select **Network > Hosts**.
2. Select how you want to set the host and domain names:
   - **Obtain Settings using DHCP**.
   - **Manually**.
     - Enter a host name.
     - Enter a domain name, which is the domain name associated with DD Management Center. Typically, this is your company domain name. For example, yourcompany.com
3. Click **Apply**.
Mapping hosts

Use the Hosts Mapping area to add a mapping that ties an IP address to a hostname. Mapping Hosts is required when DNS is not configured. DNS maps a device's name with its IP address. If DD Management Center is not configured in DNS (and if the Data Domain systems are not configured to use DNS), then host mapping is required.

Adding a host name mapping

You can add a host name mapping, while adding a new host name, if necessary.

Procedure

1. Select Add in the Hosts Mapping area to create a host mapping.
2. If no hosts are listed in the Host Name list, select the add (+) button.
3. In the Add Host dialog, enter an IP address and one or more host names that will be used for the mapping.

   The new host name is added to the list of Host Names. Continue to add host names as necessary.
4. Select Add.

   The mapping is created, and you are returned to the Hosts page.
5. To save the newly created Host Mapping, click on Apply.

Deleting a host name mapping

You can delete a host name mapping through the Host Name mapping table.

Procedure

1. In the Mapping table, select the rows you want to delete.
2. Click the Delete button above the Mapping table.
3. Click Apply to save the changes.
4. Select Close when the Completed message appears.

   You are returned to the Settings tab.

Configuring DNS settings

DNS settings can be configured from the Settings page, which is accessed by clicking the gear icon in the upper right corner.

Adding a DNS IP address

DNS servers are shown in a table with Add and Delete button options.

Procedure

1. Determine the method for obtaining the DNS. Choose to either:
   - Obtain DNS Settings using DHCP. (At least one interface must be configured using DHCP.)
   - Manually configure DNS:
     a. Select the plus (+) button.
b. Enter the DNS IP address.

2. Select **Apply** to save changes.

Deleting a DNS IP address

DNS servers are shown in a table with Add and Delete button options.

**Procedure**

1. Select the one or more rows from the table listing.
2. Click the Delete (X) button on the DNS IP address in the table to be deleted.
3. Select **Apply** to save changes.

Managing a domain search list

You can add or remove a domain from a domain search list.

Adding a search domain

Search Domains are shown as an Action table within the DNS page.

**Procedure**

1. Click the **Add** button (+) next to "Search domain names".
2. Enter a name in the "Search domain" text box.
3. Select **Add**.

**Results**

You should be returned to the DNS page with the newly added Search Domain added to the list.

Removing a search domain

Search Domains are shown as an Action table within the DNS page.

**Procedure**

1. Select the search domains to delete from the "Search domain names" list.
2. Click the **Delete** button (X) above the table.
3. Select **Apply**.

**Results**

Changes are applied to the system.

Configuring routes

Routes determine the path taken to transfer data to and from the local host (DD Management Center) to another network or host.

DD Management Center does not generate or respond to any of the network routing management protocols (RIP, EGRP/EIGRP, and BGP). The only routing implemented on DD Management Center is based on the internal route table, where the administrator may define a specific network or subnet used by a physical interface (or interface group).

DD Management Center uses **source-based routing**, which means outbound network packets that match the subnet of multiple interfaces will be routed over the physical interface from which they originated.
The routing for connections initiated from DD Management Center (such as for replication) depend on the source address used for interfaces using the same subnet. To force traffic for a specific interface to a specific destination (even if that interface is on the same subnet as other interfaces), you can configure a static routing entry between two systems that will override source routing.

Viewing route information

The Routes pages provides details about all of the routing information for your DD Management Center setup, including the default gateway values, and static and dynamic routes.

Procedure

1. Click the Settings button (the gear icon) in the DDMC banner, then select Network > Routes.
2. On the Routes page, view the configured static and dynamic routes (described in the following table), and create or modify routing information.

<table>
<thead>
<tr>
<th>item</th>

<td>Maximum Transfer Unit (MTU) size for physical (Ethernet) interface.</td>
</tr>
<tr>
<td>Window</td>
<td>Default window size for TCP connections over this route.</td>
</tr>
<tr>
<td>IRTT</td>
<td>Initial RTT (Round Trip Time). The kernel uses this to estimate the best TCP protocol parameters without waiting on (possibly slow) answers.</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface name associated with routing interface.</td>
</tr>
</tbody>
</table>

Setting the default IPv4 or IPv6 gateway address

You can set the default IPv4 or IPv6 gateway address by using the DHCP server or by manually configuring it.

Procedure

1. The Default IPv4 Gateway or the Default IPv6 Gateway can be set using the DHCP value or a manually configured gateway.
   a. Use DHCP value: indicates that you want to use the DHCP (Dynamic Host Configuration Protocol) server value.
   b. Manually Configure indicates that you want to manually configure the gateway address and enables the Gateway box, into which you should enter the gateway address. Changing the mode from DHCP to Manual will provide a text box for you to specify the default gateway.
2. Click Apply to save the changes.

Creating static routes

To force traffic for a specific interface to a specific destination (even if that interface is on the same subnet as other interfaces), you can configure a static routing entry between two systems that override source routing.

Procedure

1. Select Add in the Static Routes action table to create a route.
2. In the Add Static Routes dialog box, select an interface.
3. Specify the Destination by selecting one of the following:
   - Network – Type the network IP address and netmask.
     Note
     This is not the IP address of the interface.
   - Host – Type the hostname or IP address of the destination host of the route.
4. Optionally, type a new gateway address in the Gateway box.
5. Select Add to close the dialog box and save changes.

The new route is now added to the Static Routes table in the Routes page.
6. To save the newly created Route Spec, click **Apply**.

### Deleting static routes

You can delete static routes when you no longer need them.

**Procedure**

1. In the **Route Spec** area, select the route specification to delete.
2. Select **Delete**.
   The Delete Route dialog box appears.
3. Select **Delete** and **Close**.
   The selected route specification is removed from the Route Spec list.
4. Click **Apply** to save the changes to the routes list.

### Working with SNMP

To monitor DD Management Center using SNMP, you will need to install the Data Domain MIB in your SNMP Management system. The Data Domain MIB will allow SNMP queries for Data Domain-specific information.

DD Management Center also supports the standard MIB-II so you can also query MIB-II statistics for general data such as network statistics. For full coverage of available data you should use both the Data Domain MIB and the standard MIB-II MIB.

DD Management Center supports SNMP V2C and/or SNMP V3. SNMP V3 provides a greater degree of security than V2C by replacing cleartext community strings (as a means of authentication) with user-based authentication using either MD5 or SHA1. Also with SNMP V3, user authentication packets can be encrypted and their integrity verified with either DES or AES.

The default port that is open when SNMP is enabled is port 161. Traps are sent out through port 162.

### Checking SNMP status and configuration

The SNMP page shows SNMP status and properties, and the SNMP V3 and SNMP V2C configuration.

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **Network > SNMP**.
2. View information about SNMP, as described in the following tables.

#### Table 19 SNMP status

<table>
<thead>
<tr>

</tbody>
</table>

Enabling or disabling SNMP

You can enable or disable SNMP through DD Management Center.

**Procedure**

1. In the Status area, select **Enable** to use SNMP.
2. In the Status area, select **Disable** to stop using SNMP.
3. Click **Apply** to save changes.

Downloading the SNMP MIB

You can download the SNMP MIB through DD Management Center.

**Procedure**

1. In the Status area, select **Download MIB file**.
2. In the Opening DATA_DOMAIN.mib dialog, select **Save**.

Configuring SNMP properties

You can configure SNMP system location and system contacts.

**Procedure**

1. In the SNMP text fields, add an SNMP system location (a description of where DD Management Center is located) and/or an SNMP system contact (for example, the email address of the system administrator for DD Management Center).
2. Select **OK**.
3. Click **Apply** to save changes.

Managing SNMP V3 users

Procedures for managing V3 users including creating, modifying, and removing user accounts. Users on the SNMP manager have access to the agent for DD Management Center.

**Creating SNMP V3 users**

You can set up SNMP V3 users using the Action table on the SNMP Settings page.

**Procedure**

1. In the V3 Configuration Users area, select **Add**.
   
   The **Add SNMP V3 User** dialog appears.
2. In the Name text field, enter the name of the user or the SNMP manager who will have access to the agent for DD Management Center. The name must be a minimum of 8 characters.

3. Select either read-only or read-write access for this user.

4. To authenticate the user, select the checkbox for Authentication.
   a. Select either the MD5 or the SHA1 protocol.
   b. Enter the authentication key in the Key text field.
   c. To provide encryption to the authentication session, select the checkbox next to Privacy.
   d. Select either the AES or the DES protocol.
   e. Enter the encryption key in the Key text field.

5. Select Apply.

The newly added user account appears in the SNMP V3 Users table.

Modifying SNMP V3 users

You can modify a variety of information about SNMP V3 users.

Procedure

1. In the Action table under the V3 Configuration section on the SNMP Settings page, select Edit.

   The Edit SNMP User dialogue.

2. Select either read-only or read-write access for this user.

3. To authenticate the user, select the checkbox for Authentication.
   a. Select either the MD5 or the SHA1 protocol.
   b. Enter the authentication key in the Key text field.
   c. To provide encryption to the authentication session, select the checkbox next to Privacy.
   d. Select either the AES or the DES protocol.
   e. Enter the encryption key in the Key text field.

4. Select Apply.

The new settings for this user account are displayed in the SNMP Users table.

Removing SNMP V3 users

If an SNMP V3 user is being used by one or more trap hosts, you must first delete the trap hosts before deleting the user.

Procedure

1. In the Action table under the V3 Configuration section on the SNMP Settings page, select Delete.

2. Verify the user name to be deleted, and select Apply.
Managing SNMP V3 and V2C trap hosts

Managing SNMP V3 and V2C trap hosts includes creating, modifying, and removing hosts that received SNMP traps.

Creating SNMP V3 and V2C trap hosts

You can create SNMP V3 and V2C trap hosts using the Action table on the SNMP Settings page.

Procedure

1. In the SNMP V3 Trap Hosts or SNMP V2C Trap Hosts area, select Add.
   The Add SNMP [V3 or V2C] Trap Hosts dialog appears.

2. In the Host text field, enter the IP address or domain name of the SNMP Host where traps will be sent.

3. In the Port text field, enter the port number for sending traps (port 162 is commonly used).

4. Select the user (SNMP V3) or the community (SNMP V2C) from the drop-down menu.
   Alternately, from the drop-down menu select Create New User (SNMP V3) to add an SNMP user, or Create New Community (SNMP V2C) to add an SNMP community.

5. Select Apply.

Modifying SNMP V3 and V2C trap hosts

You can modify the port, user, and/or community for an SNMP V3 or V2C trap host using the Action table on the SNMP Settings page.

Procedure

1. In the Trap Hosts area (either for V3 or V2C), select a Trap Host entry and select Edit.
   The Edit SNMP [V3 or V2C] Trap Hosts dialog appears. Modify any of the following items.

2. In the Port text field, enter the port number for sending traps (port 162 is commonly used).

3. Select the user (SNMP V3) or the community (SNMP V2C) from the drop-down menu.

4. Select Apply.
Removing SNMP V3 and V2C trap hosts

You can remove SNMP V3 and V2C trap hosts using the Action table on the SNMP Settings page.

Procedure
1. In the Trap Hosts area (either for V3 or V2C), select a trap host entry, and select **Delete**.
2. Verify the host name to be deleted, and select **Apply**.
   The trap host entry is removed from the Trap Hosts table.

Managing SNMP V2C communities

The Community string is sent in cleartext and is very easy to intercept. If this occurs, the interceptor can retrieve information from devices on your network, modify their configuration, and possibly shut them down. Instead, using the SNMP V3 Users configuration provides authentication and encryption to avoid this.

Creating SNMP V2C communities

You can create SNMP V2C communities using the Action table on the SNMP Settings page.

Procedure
1. In the Communities area, select **Add**.
   The **Create SNMP V2C Community** dialog appears.
2. In the Community text field, enter the community name of the SNMP manager who will have access to the agent for DD Management Center. The community name must be a minimum of 8 characters.
3. Select either read-only or read-write access for this community.
4. In the Hosts area, select the checkbox of a host in the list, or:
   a. Select + to add a host.
      The Host dialog appears.
   b. In the Host text field, enter the IP address or domain name of the host.
   c. Select **OK**.
      The Host is added to the host list.
5. Select **Apply**.
   The new community entry appears in the Communities table.

Modifying SNMP V2C communities

You can modify SNMP V2C communities using the Action table on the SNMP Settings page.

Procedure
1. In the Communities area, select a checkbox for the community, and select **Edit**.
   The **Modify SNMP V2C Community** dialog appears. Add or change any of the following settings.
2. Select either read-only or read-write access for this community.

3. In the Hosts area, select the checkbox of a new host in the list, or:
   a. Select + to add a host.
      The Host dialog appears.
   b. In the Host text field, enter the IP address or domain name of the host.
   c. Select OK.
      The Host is added to the host list.

4. Select Apply.
   The modified community entry appears in the Communities table.

Deleting SNMP V2C communities
If an SNMP V2C community is being used by a trap host, you must first delete the trap host before you can delete the community.

Procedure
1. In the Communities area, select a checkbox for the community, and select Delete.

   Note
   If the Delete button is disabled, the selected community is being used by one or more trap hosts. Delete the trap hosts, and then delete the community.

2. Verify the community name to be deleted, and select Apply.
   The community entry is removed from the Communities table.

Managing access to DD Management Center
Access management includes viewing and configuring the services that provide administrator and user access to DD Management Center.

Roles required for DD MC tasks
Since mutual trust is established between DD MC and its managed Data Domain systems, if a user is added to DD MC with admin or limited-admin level access, that user can also access the managed Data Domain systems by launching DD System Manager to perform admin-level operations. Also, an admin-level user or limited-admin user can upgrade a managed Data Domain system. Therefore, you should give each new DD MC user the same consideration that you would a new DD System Manager user.

The roles available in DD MC are the same as those in DD System Manager:

- **admin**, the DD MC Administrator. An admin can access all functions on a DD MC page.
- **limited-admin**, a DD MC Limited-Administrator. The limited-admin role can configure and monitor the Data Domain system with some limitations. Users who are assigned this role cannot perform data deletion operations, edit the registry, or enter bash or SE mode.
• *user*, a *DD MC User*. A user, which can be a stand-alone user or part of a group, has access to only certain functions on a DD MC page, based on the role assigned to that user or group.

The following table shows the actions available for each feature of DD Management Center. [This table is mainly provided to show when only the *user* role is required. The *admin* role can perform all tasks, as previously mentioned.]

**Table 23 DD MC Roles required for DD MC tasks**

<table>

### Managing administrator access

Administrator Access provides settings to configure how users can connect to DD Management Center. Each protocol is configured separately, using the procedures in this section.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DDMC banner, then select **Access > Administrator Access**.
2. View the **Passphrase**, if it is set, or set it, if not. The Passphrase is a human-readable (understandable) key – like a smart card – which is used to generate a machine-usable AES 256 encryption key. (For more information, see the *Data Domain Operating System Administration Guide.* You can also view the available services, and for a selected service, the service options that are configured for it.

### Table 24 Details

<table>
<thead>
<tr>
<th>Item</th>

Managing FTP access

You can provide access to DD Management Center through an FTP connection.

Procedure

1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Administrator Access.
2. In the Services area, select FTP, and click Edit.
3. In the Access dialog, select Enabled or Disabled. If FTPS is enabled, it will be disabled before enabling FTP.
4. In Session Timeout, enter, in seconds, the interval that must elapse before the connection closes, or choose the default of Infinite.
5. Determine how hosts are to connect:
   - All hosts
   - Specified hosts – Host names can be a fully qualified host name or an IP address.
To add a host, select Add (green plus sign). Enter the host name, and click Save.

To modify a host name, select the host name in the Hosts list, click Edit (pencil), change the host name, and click Save.

To remove a host name, select the host name in the Hosts list, click Delete (X), and click Save.

6. Click Apply to save changes.

Managing FTPS access

You can provide access to DD Management Center through an FTPS connection.

Procedure

1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Administrator Access.
2. In the Services area, select FTPS, and click Edit.
3. In the Access dialog box, select Enabled or Disabled. If FTP is enabled, it is disabled before enabling FTPS.
4. In Session Timeout, type, in seconds, the interval that must elapse before the connection closes, or choose the default of Infinite. To return to default values, select the Default button.
5. Determine how hosts are to connect:
   - All hosts
   - Specified hosts – Host names can be a fully qualified hostname or an IP address.
     - To add a host, select Add (green plus sign). Type the hostname, and click Save.
     - To modify a hostname, select the hostname in the Hosts list, click Edit (pencil), change the hostname, and click Save.
     - To remove a hostname, select the hostname in the Hosts list, click Delete (X).
6. Click Apply to save changes.

Managing HTTP/HTTPS access

You can provide access to DDMC through an HTTP and/or HTTPS connection.

Procedure

1. Click the Settings button (the gear icon) in the DDMC banner, then select Access > Administrator Access.
2. In the Services area, select HTTP/HTTPS, and click Edit.
3. In the Edit HTTP/HTTPS Access dialog box, select Enabled or Disabled, and a port for HTTP and HTTPS.
4. In Session Timeout, type, in seconds, the interval that must elapse before the connection closes, or choose the default of Infinite. The default value is 10,800 seconds (3 hours).
5. Determine how hosts are to connect:
   - All hosts
- **Specified hosts** – Host names can be a fully qualified hostname or an IP address.
  - To add a host, select Add (green plus sign). Type the hostname, and click **Save**.
  - To modify a hostname, select the hostname in the **Hosts** list, click Edit (pencil), change the hostname, and click **Save**.
  - To remove a hostname, select the hostname in the **Hosts** list, click Delete (X), and click **Save**.

6. Click **Apply** to save changes.

### Results

**Table 26 HTTP/HTTPS enabled or disabled**

<table>

</tr>
</tbody>
</table>

### Managing SCP/SSH access

You can provide access to DD Management Center through an SCP and/or SSH connection.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **Access > Administrator Access**.
2. In the **Services** area, select **SSH/SCP**, and click **Edit**.
3. In the Edit HTTP/HTTPS Access dialog box, select **Enabled** or **Disabled**, and a port for SSH and SCP.
4. In **Session Timeout**, type, in seconds, the interval that must elapse before the connection closes, or choose the default value of **Infinite**.
5. Determine how hosts are to connect:
   - **All hosts**
   - **Specified hosts** – Host names can be a fully qualified hostname or an IP address.
     - To add a host, select Add (green plus sign). Type the hostname, and click **Save**.
     - To modify a hostname, select the hostname in the **Hosts** list, click Edit (pencil), change the hostname, and click **Save**.
     - To remove a hostname, select the hostname in the **Hosts** list, click Delete (X), and click **Save**.
6. Click **Apply** to save changes.
Managing Telnet access

You can provide access to DD Management Center through a Telnet connection.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **Access > Administrator Access**.
2. In the **Services** area, select Telnet, and click **Edit**.
3. In the Access dialog box, select **Enabled** or **Disabled**.
4. In **Session Timeout**, type, in seconds, the interval that must elapse before the connection closes, or choose the default of **Infinite**. To return to default values, select the **Default** button.
5. Determine how hosts are to connect:
   - **All hosts**
   - **Specified hosts** – Host names can be a fully qualified hostname or an IP address.
     - To add a host, select Add (green plus sign). Type the hostname, and click **Save**.
     - To modify a hostname, select the hostname in the **Hosts** list, click **Edit** (pencil), change the hostname, and click **Save**.
     - To remove a hostname, select the hostname in the **Hosts** list, click **Delete** (X), and click **Save**.
6. Click **Apply** to save changes.

Managing certificates

Certificates are managed by importing CA root and CA intermediate files through the GUI.

CA files provide the following:

- Allows only https application for imported host type.
- Imported host type allows file type to import a PKCS 12 file (.p12), a signed public file (.pem) or use certificate text.
- Can upload a PKCS 12 file (.p12) or a signed public file (.pem) for imported host type.
- Imported p12 file require password.
- User has the option to generate a certificate signing request when select .pem file type option for imported host type.
- User can paste certificate content into the certificate text area as import certificate.

CA intermediate files provide the following:

- Allows only trusted CA application for imported CA type.
- Imported CA type allows file type to import a signed public file (.pem) or use certificate text.
### Procedure

1. To import CA Root, enter the following command in Windows or Linux CLI:

   ```bash
   ssh sysadmin@DDMC adminaccess certificate import ca application
   login-auth < rootCA.crt
   ```

2. To import the intermediate CA files, enter the following command in the CLI:

   ```bash
   ssh sysadmin@DDMC adminaccess certificate import ca application
   login-auth < intermediateCA.crt
   ```

### Managing local user access to DD Management Center

The extent to which you can manage local user access to DD Management Center depends on your role.

If you are an *administrator* on DD Management Center, you become a *global administrator*, and you can configure and monitor all managed Data Domain systems.

If you are a *user* on DD Management Center, you can view only the managed Data Domain systems to which you have been assigned a *user*, *admin*, or *limited-admin* role by a DD Management Center administrator.

### Viewing local user information

The datestamps in the user-authentication module use Greenwich Mean Time (GMT). Therefore, when configuring expiration dates for disabling a user’s account and password, the expiration date should reflect GMT instead of local time.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **Access > Local Users**.

2. On the Local Users page, view information for the configured users.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>User ID, as added to the system.</td>
</tr>
</tbody>
</table>
| Role       | Possible roles of users based on a set of privileges:  
- *admin role*: Can configure and monitor the entire Data Domain system.  
- *limited-admin role*: Can configure and monitor the entire Data Domain system, but cannot delete/destroy Mtree data.  
- *user role*: Can monitor Data Domain systems and perform the fastcopy operation.  
Users with admin roles can view all users. Users with user roles can view only their own user account. |
Table 27 Information for configured users (continued)

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
</table>
| Status        | • enabled – User access to the account is permitted.  
|               | • disabled – User access to the account is denied because the expiration date for the account has been reached or a locked account’s password has not been renewed. Admin users can disable/enable users with admin, limited-admin, or user roles, except SysAdmin User. No users can disable SysAdmin. Security officers can disable/enable only other security officers.  
|               | • locked – User access to the account is denied because the password has expired. |
| Disable Date  | Date the account is set to be disabled.                                      |
| Last Login From| Location where the user last logged in.                                     |
| Last Login Time| Time the user last logged in.                                               |

3. Select a specific user to see Detailed Information.

Table 28 Specific user detailed information

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Last Changed</td>
<td>Date the password was last changed.</td>
</tr>
<tr>
<td>Minimum Days Between Change</td>
<td>Minimum number of days between password changes that you allow a user. Default is 0.</td>
</tr>
<tr>
<td>Maximum Days Between Change</td>
<td>Maximum number of days between password changes that you allow a user. Default is 90.</td>
</tr>
<tr>
<td>Warn Days Before Expire</td>
<td>Number of days to warn the users before their password expires. Default is 7.</td>
</tr>
<tr>
<td>Disable Days After Expire</td>
<td>Number of days after a password expires to disable the user account. Default is never.</td>
</tr>
</tbody>
</table>

Note

The default password policy can be changed by an admin or limited-admin by selecting Manage Password Policies. Default values are the initial default password policy values.

User roles

Roles provide a way to restrict user access to system functions by using a set of privileges. Permissions allow an admin or limited-admin access to specific groups and systems, reducing the need to configure every user as a global admin.

DD Management Center supports the following roles:

- *admin role*: This role can configure and monitor the entire DD Management Center system.
Note

It is recommended that the admin role be used judiciously and assigned to very few users, as these users will be able to configure DD Management Center as well as have access to all registered Data Domain systems.

- **limited-admin role**: This role can configure and monitor the entire DD Management Center system, but it cannot delete or destroy MTrees.
- **user role**: This role can monitor DD Management Center and Data Domain systems for which the user has permission.

Creating local users

You can create users with either the *admin*, *limited-admin*, or the *user* role.

Procedure

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **Access > Local Users**.
2. Click **Add**.
3. In the Add local User dialog box, type the following in the General tab:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>User ID or name.</td>
</tr>
<tr>
<td>Role</td>
<td>Management role assigned to the user:</td>
</tr>
<tr>
<td></td>
<td>• <em>Administrator and limited-admin</em>: Can configure and monitor the entire DD Management Center and all Data Domain systems.</td>
</tr>
<tr>
<td></td>
<td>• <em>User</em>: Can monitor DD Management Center and Data Domain systems for which they have permission.</td>
</tr>
<tr>
<td>Password</td>
<td>User password. Set a default password, and the user can change it later. The default value for the minimum length of a password or minimum number of character classes required for a user password is 1. Allowable character classes include:</td>
</tr>
<tr>
<td></td>
<td>• lowercase letters (a-z)</td>
</tr>
<tr>
<td></td>
<td>• uppercase letters (A-Z)</td>
</tr>
<tr>
<td></td>
<td>• numbers (0-9)</td>
</tr>
<tr>
<td></td>
<td>• special characters ($, %, #, +, and so on)</td>
</tr>
<tr>
<td>Verify Password</td>
<td>User password, again.</td>
</tr>
<tr>
<td>Disable account on the following date</td>
<td>Select <strong>Manual</strong> and type a date (mm/dd/yyyy) when you want to disable this account, or use the default value of never. This date uses GMT.</td>
</tr>
<tr>
<td>Minimum Days Between Change</td>
<td>Minimum number of days between password changes that you allow a user. Default is 0.</td>
</tr>
<tr>
<td>Maximum Days Between Change</td>
<td>Maximum number of days between password changes that you allow a user. Default is 99,999.</td>
</tr>
</tbody>
</table>
Table 29 General tab (continued)

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Warn Days Before Expire</td>
<td>Number of days to warn the users before their password expires. Default is 7.</td>
</tr>
<tr>
<td>Disable Days After Expire</td>
<td>Number of days after a password expires to disable the user account. Default is Never.</td>
</tr>
</tbody>
</table>

4. Select Add.

Note

The default password policy can be changed by the admin or limited-admin using Manage Password Policies. The default values are the initial default password policy values.

5. Click Apply to save changes.

Modifying a local user profile

You can modify several aspects of a local user profile.

Procedure

1. Click the Settings button (the gear icon) in the DDMC banner, then select Access > Local Users.
2. Select a user name, and click Edit.
3. In the Edit Local User dialog: change the assigned role.
   a. Enable or disable the user.
   b. Change the user role.
   c. Change the password for the user.
   d. Set a date to disable the username.
4. Optionally change the password aging policy for the user

Table 30 Password aging policy

<table>

</tr>
<tr>
<td>Disable Days After Expire</td>
<td>Number of days after a password expires to disable the user account. Default is Never.</td>
</tr>
</tbody>
</table>

5. Click Save.
Deleting a local user

You can delete certain users, based on your user role. If one of the selected users cannot be deleted, the Delete button will be disabled. For example, sysadmin cannot be deleted.

Procedure

1. From the Local Users tab, select one or more user names from the list.
2. Select Delete to delete the user accounts.
3. In the Delete User dialog, click Apply to save changes.

Enabling or disabling local users

You can enable or disable local users.

Procedure

1. From the Local Users tab, select one or more user names from the list.
2. Select either the Enable or Disable button.
3. In the Enable User or Disable User dialog, click Apply to save changes.

Changing user passwords

The Change Password dialog lets you change the password for a selected user.

Procedure

1. From the Local Users tab, select a user name from the list.
2. Select Change Password.
3. In the Change Password dialog, enter the new password into the New Password box. (If prompted, enter the old password, as well.)
4. Enter the new password again in the Verify New Password box.
5. Click Apply to save changes.

Changing login options

You can modify settings for password composition, time to change passwords, limiting login tries, and so forth.

Procedure

1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Local Users > Manage Password Policies.
2. In the Manage Password Policies dialog box, type the password policy information.

<table>

<tr>
<td>Maximum login tries</td>
<td>Specify the maximum number of login tries before a mandatory lock is applied to a user account. This limit applies to all user accounts, including sysadmin. A locked user cannot log in while the account is locked. The range is 4 to 20. Default is 4.</td>
</tr>
<tr>
<td>Unlock timeout (seconds)</td>
<td>Specify how long a user account is locked after the maximum number of login tries. When the configured unlock timeout is reached, a user can re-attempt to login. The range is 120 seconds to 3,600 seconds. Default is 120 seconds.</td>
</tr>
</tbody>
</table>

3. Click **Apply** to save changes.
Active users

Active users are users that are currently logged into DD Management Center.

Viewing active users

You can view a variety of information about users who are currently logged in to DD Management Center.

1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Active Users.
2. View the list of active users displayed.

Table 32 Active users

</tr>
</tbody>
</table>

Configuring authentication

DD Management Center lets you configure three types of authentication: Active Directory, Workgroup, and NIS.

NIS authentication

Local user accounts on a Data Domain system start with a UID of 500. When you set up a Data Domain system in an NIS (network information service) environment, be aware of potential UID conflicts between local and NIS user accounts. To avoid such conflicts, during initial planning consider the size of potential local accounts when you define allowable UID ranges for NIS users.

Procedure

1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Authentication.
2. Click the NIS tab.
3. In the NIS Authentication area, view information about NIS Servers and configured NIS Groups, as described in the following table.

Table 33 NIS Authentication Information

<table>
<thead>
<tr>
<th>item</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NIS Status</td>
<td>Status of service: enabled or disabled</td>
</tr>
<tr>
<td>Domain Name</td>
<td>Name of domain for this service</td>
</tr>
<tr>
<td>Server</td>
<td>Name of server performing authentication</td>
</tr>
</tbody>
</table>
Table 33 NIS Authentication Information (continued)

<table>
<thead>
<tr>

<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NIS Group</td>
<td>Name of NIS group</td>
</tr>
<tr>
<td>Management Role</td>
<td>Management role assigned to group (admin or user)</td>
</tr>
</tbody>
</table>

4. You may add, edit, or delete any of this information by selecting the appropriate control.

**Enabling NIS authentication**

The NIS (network information service) domain maintains a centralized repository of users, groups, and server names. NIS adds a global directory that authenticates users from any host on the network.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **Access > Authentication**.
2. Click the **NIS** tab.
3. In the **Status** area, select **Enabled**.
4. Select **Apply**.

**Disabling NIS authentication**

After you have enabled NIS authentication, you may occasionally need to disable it.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **Access > Authentication**.
2. Click the **NIS** tab.
3. In the **Status** area, select **Disabled**.
4. Select **Apply**.

**Configuring NIS domain names**

If an NIS domain name is invalid, it may take a long time to process. Be sure to enter a valid domain name.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **Access > Authentication**.
2. Click the **NIS** tab.
3. Enter the new domain name in the Domain Name text box.
4. Click **Apply**.

**Configuring NIS servers**

You can manually configure NIS servers, or you can obtain them from DHCP (dynamic host configuration protocol). When you manually configure them, you can add, modify, or delete servers.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **Access > Authentication**.
2. Click the NIS tab.
3. In the NIS Servers area, select Manual.
4. To add a server, click Add (green plus sign) and specify a name.
5. To delete a server, select the server, then click Delete (red X).
6. Select Apply.

Configuring NIS groups
You can add, modify, or delete NIS groups.

Procedure
1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Authentication.
2. Click the NIS tab.
3. To add a group, click Add (green plus sign). Enter a name, select a management role (admin or user), and click Add.
4. To modify a group, select the group and click Modify (pencil). Edit the name and/or management role (admin or user), and click Save.
5. To delete a group, select the group, and click Delete (X).
6. Click Apply.

Windows authentication
Windows authentication can be configured using workgroups or Active Directory.

1. Click the Settings button (the gear icon in the upper right corner) in the DD Management Center banner, then select Access > Authentication.
2. Click the Windows tab.
3. Select Using Workgroup or Using Active Directory from the Method drop-down list.
   For workgroup authentication, view information about CIFS servers and configured workgroups, as described in the following table.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workgroup name</td>
<td>Name of the workgroup the DD Management Center instance resides in.</td>
</tr>
<tr>
<td>CIFS server</td>
<td>Name of the CIFS server where the DD Management Center is connected.</td>
</tr>
</tbody>
</table>

For Active Directory authentication, view information about Active Directory, as described in the following table.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Realm name</td>
<td>Name of the Active Directory Realm.</td>
</tr>
<tr>
<td>User name</td>
<td>Name of the Active Directory user.</td>
</tr>
<tr>
<td>Password</td>
<td>Active Directory password.</td>
</tr>
</tbody>
</table>
Table 35 Active Directory information (continued)

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CIFS server</td>
<td>Name of the CIFS server where the DD Management Center is connected.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>Active Directory domain controller where the DD Management Center is connected.</td>
</tr>
<tr>
<td>Organizational unit</td>
<td>Name of the organizational unit the DD Management Center instance resides in.</td>
</tr>
<tr>
<td>Windows group</td>
<td>Name of the Windows group the DD Management Center instance resides in.</td>
</tr>
</tbody>
</table>

Configuring Workgroup authentication

Workgroup mode joins DD Management Center to a workgroup domain.

Procedure

1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Authentication.
2. Click the Windows tab.
4. For Workgroup Name, select Manual to enter a different Workgroup name in the text box.
5. For CIFS Server Name, select Manual to enter a different CIFS server name (Data Domain system) in the text box.
6. Click Apply.

Active directory authentication

If Active Directory is configured, you can use the Active Directory Authentication panel to view associated information.

Procedure

1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Authentication.

Note

Username and password are always required to apply changes.

Configuring Active Directory authentication

DD Management Center must meet all Active Directory requirements, such as a clock time that differs no more than five minutes from that of the domain controller.

Procedure

1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Authentication.
Entering Realm Name and credentials
A Windows KDC (Key Distribution Center) requires the Realm Name and credentials for Active Directory authentication.

Procedure
1. In the Realm Name text box, enter the complete realm name for DD Management Center, such as domain1.local.
2. In the User Name text box, enter a user name. This user could be either in a domain to be joined or in a domain that is a trusted domain of your company. This user must have permission to create accounts in this domain. The user name must be compatible with Microsoft requirements for the Active Directory domain being joined.
3. In the Password text box, enter a password. The password must be compatible with Microsoft requirements for the Active Directory domain being joined.

Configuring advanced active directory settings
You may optionally configure advanced active directory settings for CIFS Server Name, Domain Controllers, and Organizational Unit.

Procedure
1. For CIFS Server Name:
   • Select Use default: xxx to use the default CIFS server name, or
   • Select Manual, and enter the CIFS server name in the text box.
2. For Domain Controllers:
   • Select Automatically assign, which is the default and recommended method, or
   • Select Manual, and enter controller name(s) in the text box(es). Up to three controller names can be added. You can enter fully qualified domain names, host names, or IP (IPv4 or IPv6) addresses.
3. For Organizational Units:
   • Select Use default: xxx to use the default Organization Units, or
   • Select Manual, and enter the Organizational Unit name in the text box.

Note
The account is moved to the new Organizational Unit.

4. Select OK.

After you finish
After configuring Windows authentication, you must enable CIFS authentication from the DD Management Center command line:
adminaccess authentication add cifs

Creating Windows groups
A Windows group is a group (based on one of the user roles – admin or user) that exists on a Windows domain controller.

Procedure
1. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Authentication.
2. Click the Windows tab.
4. Click Add.
5. Specify a Windows group.
6. Specify a role.
7. Click Add.
8. Click Apply.

**Modifying Windows groups**
After you have created a Windows group, you can modify it, as needed.

**Procedure**
1. Select Administration > Settings > Access tab > Authentication.
2. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Authentication.
3. Click the Windows tab.
5. Select a Windows group, and click Edit.
6. Edit the group name in the text box. The domain for the group must be specified, for example, domain\group name.
7. Click Save.
8. Click Apply.

**Deleting Windows groups**
You cannot delete default Windows groups, such as Domain Admins. If a default Windows group is selected, the Delete button will be grayed out.

**Procedure**
1. Select Administration > Settings > Access tab > Authentication.
2. Click the Settings button (the gear icon) in the DD Management Center banner, then select Access > Authentication.
3. Click the Windows tab.
5. Select a Windows group, and click Delete.
6. Click Apply.

**LDAP authentication**
Lightweight Directory Access Protocol (LDAP) can be used to authenticate users with DDMC access. An LDAP user can manage Data Domain systems.

**Note**
Enabling LDAP status disables NIS status if NIS is enabled. Enabling NIS status disables LDAP status if LDAP is enabled.

**Procedure**
1. Click the Settings button (the gear icon) in the DDMC banner, then select Access > Authentication.
2. Click the LDAP tab.
3. In the LDAP Authentication area, view information about LDAP servers and configured LDAP groups, as described in the following table.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Status of service: enabled or disabled</td>
</tr>
<tr>
<td>Base suffix</td>
<td>Point from where a server searches for users</td>
</tr>
<tr>
<td>Bind DN</td>
<td>Location of the user in LDAP directory tree</td>
</tr>
<tr>
<td>Bind password</td>
<td>Password to access bind DN</td>
</tr>
<tr>
<td>SSL</td>
<td>Status: enabled or disabled</td>
</tr>
<tr>
<td>Note</td>
<td>If SSL is disabled, Protocols and Demand server certificate cannot be edited.</td>
</tr>
<tr>
<td>Protocols</td>
<td>SSL protocol: LDAPS or StartTLS</td>
</tr>
<tr>
<td>Demand server</td>
<td>Status: enabled or disabled</td>
</tr>
<tr>
<td>certificate</td>
<td></td>
</tr>
<tr>
<td>LDAP server</td>
<td>Name of server performing authentication</td>
</tr>
<tr>
<td>LDAP group</td>
<td>Name of LDAP group</td>
</tr>
<tr>
<td>Role</td>
<td>Management role that is assigned to group (admin or user)</td>
</tr>
</tbody>
</table>

4. Add, edit, or delete any of this information by selecting the appropriate control.

**Enabling LDAP authentication**

The LDAP (Lightweight Directory Access Protocol) server

**Note**

Enabling LDAP status will disable NIS status if NIS status enabled, and enabling NIS status will disable LDAP status if LDAP status is enabled.

**Procedure**

1. Click the Settings button (the gear icon) in the DDMC banner, then select Access > Authentication.
2. Click the LDAP tab.
3. In the Status area, select Enabled.
4. Select Apply.

**Disabling LDAP authentication**

After LDAP authentication is enabled, there may occasionally be instances where it needs to be disabled.

**Procedure**

1. Click the Settings button (the gear icon) in the DDMC banner, then select Access > Authentication.
2. Click the NIS tab.
3. In the Status area, select Disabled.
4. Select Apply.

Configuring LDAP base suffix

Procedure
1. Click the Settings button (the gear icon) in the DDMC banner, then select Access > Authentication.
2. Click the LDAP tab.
3. Type the Base suffix in the text box.
4. Click Apply.

Configuring LDAP Bind DN

Procedure
1. Click the Settings button (the gear icon) in the DDMC banner, then select Access > Authentication.
2. Click the LDAP tab.
3. Type the Bind DN in the text box.
4. Click Apply.

Configuring LDAP server

You can manually configure LDAP servers, or you can obtain them from DHCP (dynamic host configuration protocol). When you manually configure them, you can add, modify, or delete servers.

Procedure
1. Click the Settings button (the gear icon) in the DDMC banner, then select Access > Authentication.
2. Click the LDAP tab.
3. To add a server, click Add (green plus sign), and specify a name.
4. To delete a server, select the server, then click Delete (red X).
5. Select Apply.

Configuring LDAP groups

Add, modify, or delete LDAP groups.

- An LDAP group will show up in the edit permission page user list.
- An LDAP user in an configured LDAP group can access DDMC like NIS or an AD user.
- An LDAP user associated with a configured LDAP group can launch DDSM.

Procedure
1. Click the Settings button (the gear icon) in the DDMC banner, then select Access > Authentication.
2. Click the LDAP tab.
3. To add a group, click Add (green plus sign). Enter a name, select a management role (admin or user), and click Add.
4. To modify a group, select the group, and click **Edit** (pencil). Edit the name and/or management role (admin or user), and click **Save**.

5. To delete a group, select the group, and click **Delete** (X).

6. Click **Apply**.

**Managing general configuration settings**

By accessing the Settings via the gear icon in the DDMC Banner, you can manage settings for your mail server, how time and date are obtained, and some system properties (location and default administrator’s email and host name).

**Configuring time and date settings**

You can set or change the settings for your time zone, as well as how the timing for your system is synchronized [not synchronized or with NTP (Network Time Protocol)].

**Procedure**

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **System > Time and Date**.

2. Set how time is synchronized:
   - To manually set the time and date, select **Manual**, type the date in the text box, and use the drop-down lists to set the time.
   - To use NTP to synchronize the time, select **NTP**, and choose how to access the NTP server:
     - **Obtain NTP Servers using DHCP** – DHCP (Dynamic Host Configuration Protocol) will automatically select a server.
     - **Manually Configure** – Add the IP address of the server in the **NTP Servers** area.

3. Select **Apply**.

**Note**

Changes to the **Time and Date** settings require a DD Management Center restart to take full effect.

**Configuring system properties**

You can provide an admin email address to be added to the alert and autosupport notification lists, and an admin host to be added to the FTP and Telnet access lists, using the Properties configuration page in the Settings Lightbox.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DDMC banner, then select **System > Properties**.

2. The Location text field shows where the system is located. [This text field is not used by DD Management Center (or DD OS); it is here simply for your information.]

3. In the Default Administrator section, enter an email address to be automatically added to the alert and autosupport notification lists, and a host to be
automatically added to the FTP and Telnet access lists. Entering ALL in this field allows all hosts to FTP and Telnet in.

4. Click **Apply**.

### Configuring mail server settings

You can set or change the name of your mail server using the Set Mail Server dialog.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DDMC banner, then select **System > Properties**.
2. Enter the name of the mail server in the text box.
3. Click **Apply**.

### Checking a DD Management Center serial number

Each DD Management Center virtual machine has a unique serial number, which is used to identify the system in autosupport messages.

**Note**

Serial numbers cannot be added or changed. They are automatically assigned.

1. Click the **Settings** button (the gear icon) in the DD Management Center banner, then select **System > Properties**.
2. View the serial number listed.

**Note**

DD Management Center does not require a license, but the managed Data Domain systems must have licenses for their core and optional features.

### Managing alerts

You can configure settings to determine who will receive DD Management Center alert notifications and daily alert summaries.

DD Management Center and Data Domain systems (DD OS) use the same alert system. Detailed information about the alert system is described in the *Data Domain Operating System Administration Guide*.

### Managing alert notifications

The groups that are configured to receive DD Management Center alert notifications are listed in the **Settings > System > Support > Notifications** tab. Selecting a group in the table populates the Details panels for alert class attributes and subscribers who receive notification when alerts reach the severity that is configured for the alert class.

**Filtering the notifications list**

To filter (or search for an item) in the notifications group list, type a group name and/or subscriber email in the appropriate text box in the Filter By area. Then select
Update. The result is displayed at the top of the notification list. Select Reset to return the group list to the default order.

Creating a notification group

By default, all alerts are sent to the autosupport-alert@autosupport.datadomain.com email group, but additional groups can be created to receive specific classes of alert notifications.

Procedure

1. Click the Settings button (the gear icon) in the DDMC banner, then select System > Support > Notifications.
2. In the Real Time Alerts area, click Add.
3. In the Add Notification Group dialog, type a name for the group in the Group Name text box.
4. Select the alert class attributes, and set the severity level at which notifications are to be sent.
   For example, you could create a CriticalWarnings group, select all classes, and set the severity level to Critical.
5. In the Subscribers panel, click Add (green plus sign), add the email address of a subscriber, and select OK.
6. Repeat this step for each subscriber who needs to be added to the group, and click Add.

Verifying subscriber emails in a notification group

You can send a test email to subscribers in a notification group to verify that the email addresses are operational.

Procedure

1. In the More Tasks menu, select Send Test Alert.
2. In the Notification Groups panel, select the rows of the groups to receive the test email, then select Next.
3. In the Additional Email Addresses panel, add or modify email addresses, if necessary.
4. Select Send Now.

Modifying a notification group

You can modify several aspects of a notification group.

Procedure

1. Click on the row of the group in the Notifications group table, and select Modify.
2. In the Modify Group dialog, select Group Properties, and in the Class Attributes area, add or remove classes, change any severity levels, and select Next.
3. The Subscribers area displays. Add or remove any subscriber email addresses, as needed, and select Finish.
Deleting a notification group
You can delete any notification group, except the Default notification group.

Procedure
1. Select one or more rows of groups in the Notifications group table, and select Delete.
2. In the Delete Group dialog, verify the deletion, and select OK.
3. Select OK to exit the confirmation dialog.

Resetting a notification group
You can remove all notification groups that were added and remove any changes to the Default group.

Procedure
1. From the More Tasks menu, select Reset Notification Groups.
2. In the Reset Notification Groups dialog, select Yes, and in the Verification dialog, select OK.

Managing a subscriber list
You can add, modify, or delete email addresses from a notification group subscriber list.

Procedure
1. Click the Settings button (the gear icon) in the DDMC banner, then select System > Support > Notifications.
2. Select the desired notification group, and click Edit.
3. In the Edit Subscribers dialog, select one of the following options:
   • To add a subscriber, click Add (green plus sign). Enter the email address in the Email Address dialog, and click Add.
   • To modify an email address, select the email address in the Subscriber Email list, and click Modify (pencil). Edit the email address in the Email Address dialog, and click Save.
   • To delete an email address, select the email address in the Subscriber Email list, and click Delete (X).
4. Click Apply.

Managing daily alert summaries
Every morning at 8:00 a.m. local time for the DD Management Center, a Daily Alert Summary email, which contains summaries of alerts and log messages, is sent to the configured subscribers.

Procedure
1. Click the Settings button (the gear icon) in the DDMC banner, then select System > Support > Notifications.
2. If the default “8:00 AM Daily” delivery time is not acceptable, select the hour, minute, and AM/PM for a new time.
3. Manage the subscriber emails:
   • To add a subscriber, click Add (green plus sign). Enter the email address in the Email Address dialog, and click Add.
To modify an email address, select the email address in the Subscriber Email list, and click Modify (pencil). Edit the email address in the Email Address dialog, and click Save.

To delete an email address, select the email address in the Subscriber Email list, and click Delete (X).

4. Click Apply.

Managing autosupport reporting

The autosupport reporting feature emails an automatically generated daily report, called an ASUP, to Data Domain Support.

This report shows DD Management Center system identification, status information, and entries from various log files. Extensive and detailed internal statistics and information are included at the end of the report to aid support personnel with debugging, if the need arises. However, there is no information about managed Data Domain systems in this report.

Autosupport reporting is enabled by default. To disable it:

1. Click the Settings button (the gear icon) in the DDMC banner, then select System > Support > EMC Support.
2. Deselect Auto support and daily alert summary and/or Real-time alert.
3. Click Apply.

Note

For more information about autosupport reporting, see the Data Domain Operating System Administration Guide.

Using ConnectEMC or legacy email for autosupport

By default, autosupport reports are enabled and sent daily to Data Domain Customer Support using the legacy email method. The ConnectEMC method sends messages securely through an EMC Secure Remote Service (ESRS) gateway.

To determine if autosupport reporting is currently enabled, and if so, the method in use:

Procedure

1. Click the Settings button (the gear icon) in the DDMC banner, then select System > Support > EMC Support.
2. In the Channel area, select ConnectEMC.
3. Add, delete, or change the method priorities.
   - To change the method, see the Data Domain Operating System Administration Guide.
4. Select the frequency to email the DD Management Center default administrator.
5. Click Apply.
Adding to the autosupport report email list

By default, autosupport reports are enabled and sent daily to Data Domain Customer Support. You may want to add additional email addresses as recipients of autosupport reports.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DDMC banner, then select **System > Support > Notifications**.
2. In the Autosupport Report dialog, select Add (green + sign) to add an email address.
3. Click **Apply**.

Reviewing generated autosupport reports

The Autosupport Reports panel contains a list of links to current autosupport report files.

To see a generated autosupport report, select a file name link, and view the report using a text editor. If required by your browser, download the file first.

Generating a support bundle manually

When troubleshooting problems, Data Domain Support may ask you to immediately generate a support bundle, which is a tar-g-zipped selection of log files and a README file that includes identifying autosupport headers.

1. Click the **Settings** button (the gear icon) in the DDMC banner, then select **System > Support > Support Bundles**.
2. Click **Generate Support Bundles**.
3. When you see the new .tar.gz file, email it to Data Domain Support. If it is too large to be emailed, go to the Data Domain support site, and upload it.

Managing system logs

A messages file and audit log file are saved on DD Management Center and listed in the Logs area. Files can be opened and saved to a local location and then forwarded to support, if required.

**Procedure**

1. Click the **Settings** button (the gear icon) in the DDMC banner, then select **System > Support > Logs**.
2. On the Logs page, view the log file name (which is assigned automatically), the file size, and the date it was last modified. Select a log file name to view its contents. You may be prompted to select an application, such as Notepad.exe, to open the file.
3. Save the log file locally, if needed.

Upgrading DD MC software

Only DD MC admins have permission to manage software upgrade packages and perform upgrades for DD MC.

You can upgrade to DD MC 6.2 only from a system running DD MC 2.0 or 6.1. DD MC supports upgrades by only up to two release families at a time. To upgrade to DD MC from a release family earlier than 2.x, you need to upgrade in steps.
- 1.1 -> 1.2 or 1.3
- 1.2 -> 1.3 or 1.4
- 1.3 -> 1.4, 1.4.5, or 2.0
- 1.4.5 -> 2.0 or 6.1
- 2.0 -> 6.1 or 6.2

Note
The DD MC release family directly after 2.0 is 6.1; there are no 3.x, 4.x, or 5.x versions.

Upgrading DD MC software is done in two stages:
- Obtaining an image from the online support site or selecting a previously obtained upgrade image that has been saved.
- Performing the upgrade on DD MC.

Managing DD Management Center upgrade packages
You can download an upgrade image from the online support site to a locally accessible drive and then add it to the upgrade package collection managed by DD Management Center.

Procedure
1. Click the Settings button (the gear icon) in the DD Management Center banner, then select System > Upgrade.
2. In the Upgrade Packages area, view the available upgrade packages, their sizes, and their modification dates. Then, select one of the following options:
   - To get a new upgrade package to store locally, click Add, then click the EMC Online Support link.
   - To upload a package that has been stored locally to the inventory, click Add, then click the EMC Online Support link. Browse to the local drive to select the package.
   - To delete a package, select the package from the inventory list, and click Delete.
3. To perform the upgrade, see the procedure in the following section.

Performing a DD Management Center software upgrade
After you have uploaded an upgrade package, you can use it to upgrade your DD Management Center software.

Note
Software upgrade files use the .rpm file extension. This topic assumes that you are updating only DD Management Center. If you make hardware changes, such as adding, swapping, or moving interface cards, you must update the DD OS configuration to correspond with the hardware changes.

Procedure
1. Review the appropriate DD Management Center Release Notes for instructions for this upgrade, and verifying available space.
Note

For most releases, upgrades are permitted from up to two prior major release versions.

2. Click the Settings button (the gear icon) in the DDMC banner, then select System > Upgrade.

3. In the Upgrade Packages Available on Data Domain System area, select the upgrade package from the list, and select Perform System Upgrade.

4. Monitor the upgrade progress from the DD Management Center console page.

5. Be aware that the upgrade process automatically reboots DD Management Center.

6. It is recommended that you keep the System Upgrade progress dialog open until the upgrade completes, or until the system powers off.

Global controls and icons

The controls and icons that are used throughout the DDMC interface are described in detail.

Table 37 Controls that perform a function

<table>
<thead>
<tr>
<th>Control</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Help" /></td>
<td>Help</td>
<td>Located in the DDMC banner, opens the top-level help page. The help is derived from the <em>Data Domain Management Center Installation and Administration Guide</em>.</td>
</tr>
<tr>
<td><img src="image" alt="Log Out" /></td>
<td>Log Out</td>
<td>Located in the DDMC banner, logs you out of DDMC.</td>
</tr>
<tr>
<td><img src="image" alt="Filter controls" /></td>
<td>Filter controls</td>
<td>The filter control is composed of two parts: the funnel icon and a drop-down list. When the funnel icon is selected, it toggles filtering on or off.</td>
</tr>
<tr>
<td><img src="image" alt="System or Group view toggle" /></td>
<td>System or Group view toggle</td>
<td>System, Group, Tenant view toggle</td>
</tr>
<tr>
<td><img src="image" alt="View by System" /></td>
<td>View by System (default)</td>
<td>Displays systems as a flat list, whose entries are sortable using the table column sorting controls.</td>
</tr>
<tr>
<td><img src="image" alt="View by Group" /></td>
<td>View by Group</td>
<td>Displays systems by their group hierarchy. In this view, sorting of the table is only performed within groups. Group listings can be expanded to a systems list.</td>
</tr>
</tbody>
</table>

Filter selection is performed with the small down arrow, which opens a drop-down list of the types of filtering that can be employed:

- **Filter by group** – Enables the selection of one or more groups. Systems belonging to the selected groups display in the work area panel.
- **Filter by property** – Enables the selection of one or more property values. Systems having those property values display in the work area panel.
- **Filter by system** – Enables the selection of one or more systems to be displayed in the work area panel.
- **Filter by rule** – Enables the creation of a filter rule (or selection of a previously created rule) that controls which systems display in the work area panel. Filter by rule is used to combine systems, groups, and properties to achieve finer granularity.
- Filtering is used in the work area panel for monitoring views, but not for Reports and Dashboard widgets.
### Table 37 Controls that perform a function (continued)

<table>
<thead>
<tr>
<th>Control</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Launch DD System Manager" /></td>

<td>Delete</td>
<td>Deletes a selected table element.</td>
</tr>
<tr>
<td><img src="image" alt="Continue" /></td>
<td>Continue</td>
<td>Continues an operation, such as adding another statement when creating a custom rule.</td>
</tr>
</tbody>
</table>

You can select the icon to display a status banner with more information about the connection problem.

### Table 38 Icons showing system and/or connection status

<table>
<thead>
<tr>
<th>Icon</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Normal" /></td>
<td>Normal – Communication between DDMC and the Data Domain system is operating normally.</td>
</tr>
<tr>
<td><img src="image" alt="Unreachable" /></td>
<td>Unreachable – The Data Domain system is not responding or is not transmitting. Data was last retrieved as of the date that is shown in the status banner.</td>
</tr>
<tr>
<td><img src="image" alt="Unmanaged" /></td>
<td>Unmanaged – The Data Domain system is suspended or unmanaged. When suspended, all data collection ceases. A system is suspended when management has been taken over by another DDMC or when the system is suspended using the CLI.</td>
</tr>
<tr>
<td><img src="image" alt="Adding" /></td>
<td>Adding – The Data Domain system is being added into the inventory.</td>
</tr>
<tr>
<td><img src="image" alt="Upgrading" /></td>
<td>Upgrading – The Data Domain system is being upgraded and is unavailable during this state.</td>
</tr>
<tr>
<td><img src="image" alt="Synchronizing" /></td>
<td>Synchronizing – Data for the Data Domain system is being synchronized. The system is unavailable during this state.</td>
</tr>
<tr>
<td><img src="image" alt="Unsupported system" /></td>
<td>Unsupported system – This system is unsupported because it is running an operating system that is not supported by this version of DD Management Center. You may view system details for it, but the data will be out of date. You will see a tooltip with an option to upgrade the system.</td>
</tr>
</tbody>
</table>
Table 39 Icons for Tenants and Tenant Units

<table>
<thead>
<tr>
<th>Icon</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>🏠</td>
<td>Tenant Unit Configuration Issues – Reported in all multi-tenancy pages, dialogs, and lightboxes, indicates that this Tenant Unit has no configured alert notification list, no storage provisioned, no hard quota set, and/or no reports configured.</td>
</tr>
</tbody>
</table>

Dashboard controls

The Dashboard > Monitoring page consists of from one to seven tabs that you create to hold any number of widgets that provide high-level, quick monitoring views of various aspects of the Data Domain environment.

Table 40 Dashboard controls

<table>
<thead>
<tr>
<th>Controls</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>🠗洀</td>
<td>Add Widget</td>
<td>Opens the Add Dashboard Widget dialog box where you can select a widget template and optional filters to create a widget.</td>
</tr>
<tr>
<td>🠗洀</td>
<td>Add/Configure Tabs</td>
<td>Opens the Add and Configure Dashboard Tabs dialog box where you can add tabs, modify tab names, or delete tabs. You can also set the number of columns and change the ordering of the tabs across the dashboard.</td>
</tr>
<tr>
<td>🠗洀</td>
<td>Maximize/Restore dashboard</td>
<td>Toggles the size of the dashboard. Maximize hides the navigation panel and Restore returns to default view, exposing the navigation panel.</td>
</tr>
</tbody>
</table>

Widget controls

Each widget includes the following standard controls.

Table 41 Widget controls

<table>
<thead>
<tr>
<th>Controls</th>
<th>Name</th>
<th>Description</th>
</tr>

APPENDIX B

Command Line Interface for DD Management Center

- Differences between DD Management Center CLI and DD OS CLI .................. 166
- Tasks available only in DD Management Center CLI .................................. 166
- config template commands ........................................................................ 166
- managed-system commands ....................................................................... 171
- task commands ......................................................................................... 175
Differences between DD Management Center CLI and DD OS CLI

The DD Management Center CLI (command line interface) was derived from the DD OS (Data Domain Operating System) CLI, but has been modified to fit the needs and tasks of DD Management Center.

- There are two unique DD Management Center commands (managed-system and task) that perform basic registration, administration, and job management functions.
- Only a subset (fifteen) of the DD OS commands (adminaccess, alerts, alias, authentication, autosupport, config, help, log, net, ntp, route, snmp, support, system, user) are included with DD Management Center; however, some arguments and output are not included because DD Management Center does not directly manage storage. The remaining DD OS commands are not included because they are solely concerned with managing storage.

To see the online help for a CLI command in DD Management Center, start a secure shell session (ssh), and type `?` at the CLI prompt, or type `man command-name`.

Tasks available only in DD Management Center CLI

It is recommended that you use the DD Management Center GUI for all system management tasks. However, you must use the DD Management Center CLI for some system administration tasks that are not available in the GUI.

- managed-system resume `host`
- managed-system suspend `host`
- managed-system sync
- system show performance `[duration duration {hr | min}] [interval interval {hr | min}]`
- system show serialno detailed
  The GUI shows the current serial number for DD Management Center, but does not support the detailed version.
- system show space
- system show stats `[view {net | iostat | sysstat}] [custom-view view-spec,...] [interval nsecs] [count count]`

config template commands

Configuration efforts of Data Domain systems with the same or very similar configuration can be minimized by now using the set of config template CLI commands to configure groups of systems.

config template create

This command creates a new configuration template from a Data Domain system and saves it in the local database on DD Management Center.

`config template create template-name from-managed-system host-name features { all | adminaccess | alerts | autosupport |`
config | net | ntp | snmp | feature-list } [description template-description ]

Note

Only one host name is allowed.

sysadmin@ddmc-sc# config template create ct_santa_clara from-managed-system ddr-santa-clara.emc.com features snmp alerts description "SNMP and Alerts configurations from ddr-santa-clara"
Creating a new configuration template "ct_santa_clara ".
Configuration template "ct_santa_clara " created.

### config template apply

This command applies a configuration template to selected Data Domain systems that are managed by DD Management Center.

`config template apply template-name to-managed-systems host-list`

**Note**

`host-list` is a list of host names managed by DD Management Center; numeric IP addresses are not allowed.

```bash
sysadmin@ddmc-sc# config template apply ct_santa_clara to-managed-systems ddr-santa-clara0.emc.com ddr-santa-clara1.emc.com
Applying configuration template will overwrite existing configuration on the specified managed system(s).
  Do you want to proceed? (yes|no) [no]: yes
Applying configuration template "ct_santa_clara"
Host: ddr-santa-clara0.emc.com
  Applying alerts: success
  Applying snmp: success
```
config template show list

This command shows a list of the configured templates available for use by the Data Domain systems that are managed by DD Management Center.

```
config template show list [template-name]
```

```
sysadmin@ddmc-sc# config template show list
Name    Host Name    DDOS Version   Creation Time       Created By
------- ------------ -------------- ------------------- ----------
ct_net0 ddr0.emc.com 5.7.0.0-493350 2016-05-04 13:13:29 user
ct_snmp ddr1.emc.com 5.7.0.0-493350 2016-05-04 13:15:04 scheduled
ct0     ddr2.emc.com 5.7.0.0-493350 2016-05-06 11:49:33 user
------- ____________ ________________ ____________ ____________
```

cfg template show detailed

This command shows the detailed settings of a configuration template that is available for use by the Data Domain systems that are managed by DD Management Center.

```
config template show detailed [template-name]
```

```
sysadmin@ddmc-sc# config template show detailed ct_snmp
Template Name: ct_snmp
Created From: ddr-santa-clara0.emc.com
Creation Time: 2016-08-23 14:19:15
Created By: user
DDOS Version: 5.7.3.0-541237
Content:
{
    "hostname": "ddr-santa-clara0.emc.com ",

        } ],
    }
}
```
config template rename

This command renames a pre-existing DD Management Center configuration template.

config template rename template-name new-template-name

sysadmin@ddmc-sc# config template rename ct_snmp_santa_clara
ct_snmp_san_jose
Configuration template “ct_snmp_santa_clara” renamed “ct_snmp_san_jose”.

config template destroy

This command destroys a configuration template saved in the local database on DD Management Center.

config template destroy template-name

sysadmin@ddmc-sc# config template destroy ct_snmp
Configuration template “ct_snmp” destroyed.

config template creation schedule set

This command can be used to set up a daily schedule to create configuration templates for all Data Domain systems managed by DD Management Center.

- A maximum of 3 copies (created by scheduler) per Data Domain system are saved.
- If no configuration is changed from the previous day, a copy is not made.

config template creation schedule set { hh:mm | never }

sysadmin@ddmc-sc# config template creation schedule set 12:00
Configuration template creation is set to run daily at 12:00.

config template creation schedule reset

This command resets a daily schedule to stop creating configuration templates for all Data Domain systems managed by DD Management Center.

config template creation schedule reset

sysadmin@ddmc-sc# config template creation schedule reset
Configuration template creation is reset to default (“never”).
managed-system commands

The DD Management Center managed-system CLI commands let you add and remove systems from management, change their proxy host settings, and suspend, resume, or synchronize data collection.

Note
You can also use the Web interface to perform these actions.

managed-system add

managed-system add hostname [force] [inbound-proxy proxy-host [inbound-proxy-port proxy-port]] [outbound-proxy proxy-host [outbound-proxy-port proxy-port]]

This command adds a Data Domain system to the set of managed Data Domain systems. The command prompts you to:

1. Verify that the certificate obtained from the host is valid.
2. Type the sysadmin password for the system being added to management.

Argument Definitions

force
If the system is already being managed by another DD Management Center, the current DD Management Center assumes management of the Data Domain system from the other DD Management Center, and the Data Domain system entry in the other DD Management Center is placed in the unmanaged state. If the system is already being managed and you omit this argument, the command fails.

hostname
The host name of the system.

inbound-proxy proxy-host
Inbound proxy host name if the incoming connection from the Data Domain system is through a proxy.

inbound-proxy-port proxy-port
Inbound proxy port number if the incoming connection from the Data Domain system is through a proxy.

outbound-proxy proxy-host
Outbound proxy host name if the connection from the DD Management Center to the Data Domain system is through a proxy.

outbound-proxy-port proxy-port
Outbound proxy port number if the connection from the DD Management Center to the Data Domain system is through a proxy.

Note
The proxy options are equivalent to the firewall options in the graphical user interface.
Example

```bash
# managed-system add host1234.mycompany.com
The SHA1 fingerprint for the remote host's CA certificate is
Do you want to trust this certificate? Are you sure? (yes|no) [no]: yes
** Once added, all "admin" role users on this management center will
operate on
"host1234.mycompany.com" system with "admin" role. To allow
"host1234.mycompany.com"
to be managed by this management center, Enter sysadmin password:
ok, proceeding.
```

managed-system check-connection

```bash
managed-system check-connection hostname [inbound-proxy proxy-host [inbound-proxy-port proxy-port]] [outbound-proxy proxy-host [outbound-proxy-port proxy-port]]
```

This command checks whether the specified host is reachable and available to be
managed by this DD Management Center. Use managed-system add to add the
system to the set of systems that this DD Management Center is managing.

Argument Definitions

- **hostname**
  The host name of the system.

- **inbound-proxy proxy-host**
  Inbound proxy host name if the incoming connection from the Data Domain
  system is through a proxy.

- **inbound-proxy-port proxy-port**
  Inbound proxy port number if the incoming connection from the Data Domain
  system is through a proxy.

- **outbound-proxy proxy-host**
  Outbound proxy host name if the connection from the DD Management Center to
  the Data Domain system is through a proxy.

- **outbound-proxy-port proxy-port**
  Outbound proxy port number if the connection from the DD Management Center
to the Data Domain system is through a proxy.

managed-system delete

```bash
managed-system delete hostname
```

This command removes the specified Data Domain system from DD Management
Center management.

Argument Definitions

- **hostname**
  The host name of the system.
**managed-system resume**

managed-system resume hostname

This command resumes data collection from the specified Data Domain system if collection was suspended by managed-system suspend.

---

**Note**

If a system is running an unsupported version of DD OS, it will be resumed, but it will be put back in an unsupported (not suspended) state.

---

**Argument Definitions**

hostname

The host name of the system.

---

**managed-system set**

managed-system set hostname [inbound-proxy {proxy-host|none}] [inbound-proxy-port {proxy-port|default}] [outbound-proxy {proxy-host|none}] [outbound-proxy-port {proxy-port|default}]

This command sets or changes proxy server information for a managed system.

**Argument Definitions**

hostname

The host name of the system.

inbound-proxy {proxy-host|none}

Inbound proxy host name if the incoming connection from the Data Domain system is through a proxy. Use none to remove the proxy host and clear the proxy port.

inbound-proxy-port proxy-port

Inbound proxy port number if the incoming connection from the Data Domain system is through a proxy.

outbound-proxy {proxy-host|none}

Outbound proxy host name if the connection from the DD Management Center to the Data Domain system is through a proxy. Use none to remove the proxy host and clear the proxy port.

outbound-proxy-port {proxy-port|default}

Outbound proxy port number if the connection from the DD Management Center to the Data Domain system is through a proxy. Use default to reset the proxy port number.

---

**managed-system show**

managed-system show [(all | hostname)]

This command prints basic information for a list of managed systems or the specified system.
Argument Definitions

all
Report about all systems. This is the default.

hostname
The host name of the system.

The report lists the systems by hostname and includes serial number, management state, online status, DD OS version, and latest synchronization time.

Management States
This list describes the possible values of the management State column.

adding
The DD Management Center is in the process of assuming management of the system.

deleting
The DD Management Center is in the process of ending management of the system.

managed
The DD Management Center is managing the system.

suspended
The DD Management Center is not currently managing and collecting information about the system. Systems go into this state if you use managed-system suspend to stop collecting data or a licensing problem prevents data collection.

unmanaged
The DD Management Center previously managed the system, but another DD Management Center has assumed management.

unsupported
This system is unsupported, because its DD OS version is not supported by this version of DD Management Center.

Management Status Values of “Managed” Systems
This list describes the possible management Status values when a system is in the managed state.

not-responding
DD Management Center has not been able to send messages to the managed system, or communication has failed in both directions, for more than 30 minutes.

not-transmitting
The managed system has not responded to messages from DD Management Center for more than 120 minutes.

online
Communication with the managed system is normal.

upgrading
The managed system is in the process of upgrading its DD OS.
The managed system is in the process of upgrading its DD OS and is not communicating with DD Management Center.

managed-system suspend

managed-system suspend hostname

This command suspends data collection from the specified host. If you do not want DD Management Center to show a system as unreachable while it is shut down for maintenance, you can use this command to suspend monitoring.

Note
If a system is not in a managed state, it cannot be suspended. If a system is running an unsupported version of DD OS, it can be suspended.

Argument Definitions

hostname
The host name of the system.

managed-system sync

managed-system sync

This command synchronizes and processes both current and historical data from all managed systems.

task commands

In the CLI, jobs are called tasks. The DD Management Center task CLI commands let you cancel, pause, resume, and generate reports about jobs. Regular users may work with tasks that they created. The sysadmin user may work on all tasks.
The Health > Jobs page in the Web interface displays information about jobs that have been initiated from DD Management Center, including jobs still in progress and jobs that have completed, whether successfully or not. Jobs include actions such as adding and removing systems from management.

task cancel

task cancel task-id

This command terminates a task.

Argument Definitions

task-id
The ID number for the task, as reported by one of the task show commands.

task pause

task pause task-id

This command suspends a task. Use task resume to continue the task.
Argument Definitions

**task-id**

The ID number for the task, as reported by one of the `task show` commands.

**task resume**

`task resume task-id`

This command continues a task that you suspended with `task pause`.

Argument Descriptions

**task-id**

The ID number for the task, as reported by one of the `task show` commands.

**task show active**

`task show active [type {inventory | replication | upgrade}] [user user]`

This command reports about top-level running tasks. You can filter the results by using `type` with one of the keywords, or with the `user` keyword.

Argument Definitions

**type {inventory | replication | upgrade}**

Filter the results to show only tasks of the specified type.

**user**

Filter the results to show only tasks owned by the specified user.

**task show detailed**

`task show detailed task-id`

This command prints a detailed report about the inputs and outputs of a task in the form of key-value list.

Argument Definitions

**task-id**

The ID number for the task, as reported by one of the `task show` commands.

Output Example

Here is an example of this command's output.

```
# task show detailed 19730
Task ID : 19730
Task Name : Adding systems
User : sysadmin
State : Success
Start Time: Tue Aug 25 14:28:40 2015
End Time : Tue Aug 25 14:29:10 2015
Host(s) : 10.25.183.48,10.25.183.4
Input(s) :
  0.ddr_name = 10.25.183.48
  1.ddr_name = 10.25.183.4
ddr_count = 2
flag = 8191
force = 1
Output(s) :
```
Step 1:
Name: Checking license status
State: Success
Start Time: Tue Aug 25 14:28:40 2015
End Time: Tue Aug 25 14:28:40 2015

Step 2:
Name: Adding systems
State: Success
Start Time: Tue Aug 25 14:28:40 2015
End Time: Tue Aug 25 14:28:40 2015

Subtask:
Task ID: 19731
Task Name: Adding system
State: Success
Start Time: Tue Aug 25 14:28:40 2015
End Time: Tue Aug 25 14:29:08 2015
Host(s): 10.25.183.48
Input(s):
- index_to_parent = 0
- ddr_count = 1
- flag = 8191
- force = 1
- ddr_name = 10.25.183.48
Output(s):
- system_name = ddve-251834.brs.lab.emc.com
- system_id = 39

Subtask:
Task ID: 19732
Task Name: Adding system
State: Success
Start Time: Tue Aug 25 14:28:40 2015
End Time: Tue Aug 25 14:29:10 2015
Host(s): 10.25.183.4
Input(s):
- index_to_parent = 1
- ddr_count = 1
- flag = 8191
- force = 1
- ddr_name = 10.25.183.4
Output(s):
- system_name = ddve-251834.brs.lab.emc.com
- system_id = 39

Step 3:
Name: Launching catalog download binary
State: Success
Start Time: Tue Aug 25 14:29:10 2015
End Time: Tue Aug 25 14:29:10 2015

Step 4:
Name: Launching historical data receiver
State: Success
Start Time: Tue Aug 25 14:29:10 2015
End Time: Tue Aug 25 14:29:10 2015

(task show detailed-active)

(task show detailed-active [type {inventory | replication | upgrade}] [user user])

This command prints a detailed report about active tasks and their subtasks. You can filter the results by using type with one of the keywords, or with the user keyword.
**Argument Definitions**

*type* {inventory | replication | upgrade}

Filter the results to show only tasks of the specified type.

*user user*

Filter the results to show only tasks owned by the specified user.

---

**task show detailed-history**

```
task show detailed-history [last n {hours | days | weeks | months}] [start MMDDhhmm[[CC]YY] end MMDDhhmm[[CC]YY] [type {inventory | replication | upgrade}] [user user]
```

This command prints a detailed report about completed tasks and their subtasks. You can filter the results by using *type* with one of the keywords, or with the *user* keyword. You can filter the results by time by using the last, start, and end keywords. The default reporting period is the past 24 hours.

**Argument Definitions**

*last n* {hours | days | weeks | months}

Filter the results to show only tasks that finished during the previous *n* hours, days, weeks, or months.

*start MMDDhhmm[[CC]YY] end MMDDhhmm[[CC]YY]*

Filter the results to show only tasks that finished during the specified interval. *MMDD* indicates month and day. *hhmm* indicates hours and minutes in 24-hour format. To specify midnight between Sunday night and Monday morning, use mon 0000. To specify noon on Monday, use mon 1200. *CC* is the first two digits of the year. *YY* is the last two digits of the year.

*type* {inventory | replication | upgrade}

Filter the results to show only tasks of the specified type.

*user user*

Filter the results to show only tasks owned by the specified user.

---

**task show history**

```
task show history [last n {hours | days | weeks | months}] [start MMDDhhmm[[CC]YY] end MMDDhhmm[[CC]YY] [type {inventory | replication | upgrade}] [user user]
```

This command prints a brief report about completed tasks. You can filter the results by using *type* with one of the keywords, or with the *user* keyword. You can filter the results by time by using the last, start, and end keywords. The default reporting period is the past 24 hours.

**Argument Definitions**

*last n* {hours | days | weeks | months}

Filter the results to show only tasks that finished during the previous *n* hours, days, weeks, or months.
start $MMDDhhmm[[CC]YY]$ end $MMDDhhmm[[CC]YY]$

Filter the results to show only tasks that finished during the specified interval. $MMDD$ indicates month and day. $hhmm$ indicates hours and minutes in 24-hour format. To specify midnight between Sunday night and Monday morning, use $\text{mon 0000}$. To specify noon on Monday, use $\text{mon 1200}$. $CC$ is the first two digits of the year. $YY$ is the last two digits of the year.

type \{inventory | replication | upgrade\}

Filter the results to show only tasks of the specified type.

user user

Filter the results to show only tasks owned by the specified user.
Command Line Interface for DD Management Center
