Improved access to HPC is generating unprecedented amounts of data

As increasingly powerful and sophisticated high-performance computing (HPC) technologies burst into the mainstream, more researchers and engineers are empowered to make new innovations and discoveries faster than ever before.

Data from these systems continue to drive the demand for high-performance storage. The flood of information generated by sensors, satellites, high-performance computer simulations, high-throughput devices and medical imaging is pushing data repositories to sizes that were once inconceivable. Researchers can generate and consume data in HPC systems at such speed that multiple petabytes to exabytes are starting to become commonplace. And the data requirements around performance and capacity keep increasing rapidly.

Because storage input/output (I/O) capabilities have typically lagged behind data processing horsepower, storage components can turn into a major bottleneck. Plus, managing and monitoring these complex storage systems significantly adds to the burden on storage administrators and researchers. Ideally, HPC storage systems should provide large-capacity, highly scalable and high-speed storage that won't strain internal IT expertise or the data center budget. But increasing the throughput and scalability of storage systems supporting the HPC system can require a great deal of planning and configuration.

Optimum HPC performance requires simple, reliable and cost-efficient storage

Dell EMC Ready Solutions for HPC Storage are preconfigured, tested and validated solutions that allow you to deploy large-capacity storage systems more easily and with less risk, while preserving resources and budget for higher-value activities. They also give you the power to quickly and easily scale storage capacity as computing needs grow.

What are your HPC storage challenges?

“It’s complex to plan and deploy HPC storage solutions.”

Designing high-throughput, highly scalable HPC storage systems requires a great deal of expert planning and configuration. In addition, working with multiple vendors to acquire, deploy and support an HPC storage system is difficult and time consuming.

Dell EMC Ready Solutions for HPC Storage are delivered with hardware, software and professional support from Dell EMC. Each system is based on development and tuning in the [Dell EMC HPC and AI Innovation Lab](#), so you get storage solutions based on detailed performance and sizing characterizations, tuning configuration and best practices. Preconfiguration and tuning simplify installation to provide faster time to results.

Dell EMC Ready Solutions for HPC Storage also simplify monitoring and overall management of HPC storage without requiring specialized training or expertise to operate, making storage simpler to maintain. Worry-free HPC deployment and management frees researchers, scientists and engineers to focus on core business and strategic research initiatives instead of managing HPC clusters.

“We need stable and secure storage systems for our critical data sets.”

Dell EMC Ready Solutions for HPC Storage take the guesswork out of configuration, reducing interoperability issues and improving service quality. The systems are built on Dell EMC PowerEdge servers and Dell EMC PowerVault storage to provide redundancy. Dell EMC engineers and industry experts have worked in collaboration with Dell EMC HPC customers and partners to design these systems in our Dell EMC HPC and AI Innovation Lab. The Dell EMC engineering team then devotes hours to rigorously tuning the system for your specific applications and workloads. The result is storage that’s highly available, with no single point of failure.

In addition, included Dell EMC ProSupport covers the storage solution in its entirety, both hardware and software, to help prevent and address potential software and hardware issues with a single source of support.

“It’s tough to scale capacity and performance to meet user demands — and stay within budget.”

Dell EMC is leading the charge to mainstream HPC by bringing costs down so this technology is available for all. Dell EMC Ready Solutions for HPC Storage allow you to meet your capacity and performance needs with compelling total cost of ownership (TCO) benefits. First, cost-optimized, industry-standard Dell EMC servers, storage and networking decrease the cost to store and process large HPC data sets. Then, preconfigured, tuned and tested solutions lower the costs of planning and deploying HPC storage. Cost-effective network file system (NFS) storage is available with virtually all Linux® distributions — lowering acquisition costs. It’s easy to configure, deploy and maintain — lowering operational costs. Lustre® features user interface-driven configuration, monitoring and overall management to lower management complexity and cost.

Dell EMC Ready Solutions for HPC Storage

Dell EMC gives you the choice of two different Ready Solutions for HPC Storage, along with the flexibility to customize a solution for your specific needs.

Dell EMC Ready Solution for HPC NFS Storage

Low cost, scalable and performant HPC storage for lower I/O needs

Storage solutions based on the NFS protocol are widely used for HPC clusters because NFS is simple and time-tested, and is a standard package in virtually every Linux distribution. These characteristics make NFS an attractive storage solution for many HPC installations.

If you have clusters running applications with lower I/O needs, NFS storage is reliable, easy to administer and has very good performance within certain boundaries. In clusters with higher I/O requirements, NFS is a good option for a secondary storage repository for home directories, application storage and longer-term storage of application data.

Solution benefits

- **Low cost:** Compute, storage, networking and software are optimized together to provide excellent performance and scalability for the money.
- **Performant:** The Dell EMC Ready Solution for HPC NFS Storage is tuned for throughput performance. Maximum random write performance is up to 6.5K IOPS, with maximum random read performance up to 18.7K IOPS.¹
- **Scalable:** Meet future needs more easily with the ability to scale easily up to 64 nodes and 480TB raw capacity in a supported single namespace to run larger, more complex applications with faster throughput capacity.
