

Dell EMC PowerScale: OneFS S3 API Guide

Abstract

This document provides technical details about Dell EMC™ PowerScale™ OneFS™ S3 API compatibility to help incorporate applications with OneFS S3. This document also includes the supported quest parameter details for each OneFS S3 API.

Executive summary

Amazon Simple Storage Service (Amazon S3) provides a set of APIs that enable applications to access object storage. With the popularity of S3 object storage, more storage vendors are implementing their own object-storage engines with S3-compatible APIs. However, some Amazon S3 APIs are designed specifically for Amazon Web Services (AWS), with example services including life-cycle management, charging, and analytics. Third-party S3-compatible storage usually implements a subset of Amazon S3 official APIs to enable object access.

Starting with Dell EMC™ OneFS™ version 9.0, Dell EMC PowerScale™ introduces the capability of data access by exposing the compatible S3 APIs. To facilitate administration and application deployment with the OneFS S3 implementation, this document shows how OneFS S3 API compatibility compares with the latest version of the [Amazon S3 API](#).

1 OneFS S3 API compatibility overview

The [Amazon S3 API](#) was originally developed as the data-access interface of Amazon S3. As applications were developed using the S3 API, it became a common standard for object storage. This document refers to the S3 API for object storage as the S3 protocol. This provides a consistent nomenclature along with other NAS protocols regarding the OneFS file service.

Starting with OneFS 9.0, PowerScale OneFS supports the Amazon S3 protocol with OneFS S3, an object-storage interface that is compatible with the Amazon S3 API. OneFS S3 enables access to file-based data that is stored on OneFS clusters as objects.

This section compares OneFS S3 API compatibility with the Amazon S3 official APIs. OneFS supports both path-style requests and virtual hosted-style requests. It uses port 9020 for HTTP and port 9021 for HTTPS by default.

Table 1 lists the latest versions of AWS S3 APIs (sourced from [Amazon S3 API](#) documentation), and shows the compatibility with OneFS S3. See section 2 and section 3 for details about each OneFS supported S3 API. The APIs are sorted alphabetically as in the Amazon S3 API documentation.

Table 1 OneFS AWS S3 API compatibility

API names	Apply to	Supported by OneFS
AbortMultipartUpload	Object	Yes
CompleteMultipartUpload	Object	Yes
CopyObject	Object	Yes
CreateBucket	Bucket	Yes
CreateMultipartUpload	Object	Yes

2 OneFS S3 supported bucket APIs

Many request parameters of Amazon S3 APIs are designed for Amazon S3 features, and OneFS does not support these parameters in its supported APIs. This section introduces the request parameters of bucket S3 APIs that are supported by OneFS. For more information about request and response examples, see the documentation [AWS S3 API Reference](#). OneFS supports the following bucket APIs:

- CreateBucket
- DeleteBucket
- GetBucketAcl
- GetBucketLocation
- HeadBucket
- ListBuckets
- ListMultipartUploads
- ListObjects
- ListObjectsV2
- PutBucketAcl

2.1 CreateBucket

Table 2 shows the details about the OneFS S3 CreateBucket API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to client.

Table 2 OneFS S3 CreateBucket API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	<p>Required: Yes</p> <p>This is the name of the bucket to create.</p> <p>Bucket names must consist of characters, including lowercase letters (a-z), numbers (0-9), or dashes (-).</p> <p>Bucket names must start or end with a lowercase letter (a-z) or number (0-9).</p> <p>Bucket names must be 3–63 characters in length.</p>
x-isi-path	Yes	<p>This is an optional OneFS extended header where a OneFS directory can be specified as the bucket path. OneFS creates the directory implicitly if the directory does not exist. See appendix A.1 for an example.</p>
x-amz-acl	Yes	<p>This is the canned ACL to apply to the bucket.</p> <p>Valid values: private, public-read, public-read-write, authenticated-read</p>
x-amz-bucket-object-lock-enabled	No	N/A
x-amz-grant-full-control	Yes	<p>This allows the grantee the read, write, read ACP, and write ACP permissions on the bucket.</p>

Request parameters/body	Supported	Description
x-amz-grant-read	Yes	This allows the grantee to list the objects in the bucket.
x-amz-grant-read-acp	Yes	This allows the grantee to read the bucket ACL.
x-amz-grant-write	Yes	This allows the grantee to create, overwrite, and delete any object in the bucket.
x-amz-grant-write-acp	Yes	This allows the grantee to write the ACL for the applicable bucket.
CreateBucketConfiguration	No	N/A
LocationConstraint	No	N/A. OneFS sets the bucket location to empty string.

Note: Amazon S3 allows specifying a grantee using the following headers: email address, id, uri in the x-amz-grant-read, x-amz-grant-write, x-amz-grant-read-acp, x-amz-grant-write-acp, and x-amz-grant-full-control. OneFS does not support the email address to specify a grantee, and 501 NotImplemented code is returned.

2.2 DeleteBucket

Table 3 shows the details about the OneFS S3 DeleteBucket API request parameters and request body. When a bucket is deleted, OneFS only removes the bucket information while preserving the data under the bucket. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to client.

Table 3 OneFS S3 DeleteBucket API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This specifies the bucket being deleted.
x-isi-force-delete	Yes	This is an optional OneFS extended header. By default, all objects (including all OneFS files and directories) in the bucket must be deleted before the bucket itself can be deleted. With the x-isi-force-delete extension, users can delete the bucket while preserving the data under the bucket. See appendix A.2 for an example.

2.3 GetBucketAcl

Table 4 shows the details about the OneFS S3 GetBucketAcl API request parameters and request body. If not specified, all unsupported request parameters and request body are silently ignored by OneFS without an error code being returned to client.

Table 4 OneFS S3 GetBucketAcl API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This specifies the S3 bucket whose ACL is being requested.

2.4 GetBucketLocation

Table 5 shows the details about the OneFS S3 GetBucketLocation API request parameters and request body. If not specified, all unsupported request parameters and request body are silently ignored by OneFS without an error code being returned to client.

Table 5 OneFS S3 GetBucketLocation API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket location being requested. OneFS always returns an empty string.

2.5 HeadBucket

This API determines if a bucket exists and if permission is granted to access it. Table 6 shows the details about the OneFS S3 HeadBucket API request parameters and request body.

Table 6 OneFS S3 HeadBucket API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket.

2.6 ListBuckets

This API returns a list of all buckets that are owned by the authenticated sender of the request. There are no request parameters and request body required for this API.

2.7 ListMultipartUploads

This API lists in-progress multipart uploads of a OneFS bucket. Table 7 shows the details about the OneFS S3 ListMultipartUploads API request parameters and request body. If not specified, all unsupported request parameters and request body are silently ignored by OneFS without an error code being returned to client.

Table 7 OneFS S3 ListMultipartUploads API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket to which the multipart upload is initiated.
delimiter	No	N/A
encoding-type	No	N/A
key-marker	No	N/A
max-uploads	Yes	This sets the maximum number of multipart uploads in the response, ranging from 1–1,000.
prefix	Partial support	This returns entries that match with given prefix.
upload-id-marker	Yes	This specifies the multipart upload after which the listing should begin. When a response is truncated, set this parameter value to the value of NextUploadIdMarker in the response to continue listing the rest of multipart uploads.

2.8 ListObjects

This API returns some or all (up to 1,000) of the objects in a bucket. Table 8 shows the details about the OneFS S3 ListObjects API request parameters and request body. If not specified, all unsupported request parameters and request body are silently ignored by OneFS without an error code being returned to client.

Table 8 OneFS S3 ListObjects API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket that contains the objects.
delimiter	Yes	A delimiter is a character used to group keys. OneFS only supports the slash (/) as delimiter.
encoding-type	No	N/A
marker	Yes	This specifies the key to start with when listing objects in a bucket. When a response is truncated, set this parameter value to the value of NextMarker in the response to continue listing the rest of objects.
max-keys	Yes	This sets the maximum number of keys returned in the response, ranging from 1–1,000.

prefix	Yes	This limits the response to keys that begin with the specified prefix.
x-amz-request-payer	No	N/A

2.9 ListObjectsV2

This API returns some or all (up to 1,000) of the objects in a bucket. Table 9 shows the details about the OneFS S3 ListObjectsV2 API request parameters and request body. If not specified, all unsupported request parameters and request body are silently ignored by OneFS without an error code being returned to client.

Table 9 OneFS S3 ListObjectsV2 API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket containing the objects.
continuation-token	Yes	This specifies that the list is being continued on this bucket with this token.
delimiter	Yes	The delimiter is a character that is used to group keys. OneFS only supports the slash (/) as delimiter.
encoding-type	No	N/A
fetch-owner	Yes	The owner field is not present in listV2 by default. If needing to return the owner field with each key in the result, set the fetch owner field to true .
max-keys	Yes	This sets the maximum number of keys that are returned in the response, ranging from 1–1,000.
prefix	Yes	This limits the response to keys that begin with the specified prefix.
start-after	Yes	This key specifies where OneFS starts the listing from. It can be any key in the bucket.
x-amz-request-payer	No	N/A

2.10 PutBucketAcl

This API sets the permissions on an existing bucket using access control lists (ACLs). Table 10 shows the details about the OneFS S3 PutBucketACL API request parameters and request body. If not specified, all unsupported request parameters and request body are silently ignored by OneFS without an error code being returned to client.

Table 10 OneFS S3 PutBucketACL API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket containing the objects.
Content-MD5	Yes	This is the base64-encoded, 128-bit MD5 digest of the data. OneFS uses the MD5 value from the client as an ETag directly instead of calculating it by itself. If the MD5 is not specified in request, OneFS generates a unique string for that file as an ETag in response.
x-amz-acl	Yes	This is the canned ACL to apply to the bucket. Valid values: private public-read public-read-write authenticated-read
x-amz-grant-full-control	Yes	This allows the grantee the read, write, read ACP, and write ACP permissions on the bucket.
x-amz-grant-read	Yes	This allows the grantee to list the objects in the bucket.
x-amz-grant-read-acp	Yes	This allows the grantee to read the bucket ACL.
x-amz-grant-write	Yes	This allows the grantee to create, overwrite, and delete any object in the bucket.
x-amz-grant-write-acp	Yes	This allows the grantee to write the ACL for the applicable bucket.

Note: Amazon S3 allows specifying a grantee using the following headers: email address, id, uri in the x-amz-grant-read, x-amz-grant-write, x-amz-grant-read-acp, x-amz-grant-write-acp, and x-amz-grant-full-control. OneFS does not support an email address to specify a grantee, and a 501 NotImplemented code is returned.

3 OneFS S3 supported object APIs

Many request parameters of Amazon S3 APIs are designed for Amazon S3 features, and OneFS does not support these parameters in its supported APIs. This section introduces the request parameters of supported OneFS S3 APIs on objects. For the request and response examples, see the [Amazon S3 API Reference](#).

OneFS supports the following bucket APIs:

- AbortMultipartUpload
- CompleteMultipartUpload
- CopyObject
- CreateMultipartUpload
- DeleteObject
- GetObject
- GetObjectAcl
- HeadObject
- ListParts
- PutObject
- PutObjectAcl
- UploadPart
- UploadPartCopy

3.1 AbortMultipartUpload

Table 11 shows the details about the OneFS S3 AbortMultipartUpload API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 11 OneFS S3 AbortMultipartUpload API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the bucket name to which the multipart upload was taking place.
Key	Yes	Required: Yes This is the key of the object for which the multipart upload was initiated.
uploadId	Yes	Required: Yes This is the upload ID that identifies the multipart upload.
x-amz-request-payer	No	N/A

3.2 CompleteMultipartUpload

This API completes a multipart upload by assembling previously uploaded parts. Table 12 shows the details about the OneFS S3 CompleteMultipartUpload API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 12 OneFS S3 CompleteMultipartUpload API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the bucket name to which the multipart upload was initiated.
Key	Yes	Required: Yes This is the key of the object for which the multipart upload was initiated.
uploadId	Yes	Required: Yes This is the upload ID that identifies the multipart upload.
x-amz-request-payer	No	N/A

3.3 CopyObject

This API creates a copy of an object that is already stored in OneFS. Table 13 shows the details about the OneFS S3 CopyObject API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 13 OneFS S3 CopyObject API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the destination bucket.
Cache-Control	No	N/A
Content-Disposition	No	N/A
Content-Encoding	No	N/A
Content-Language	No	N/A
Content-Type	No	N/A. OneFS ignores it and set to binary/octet-stream only.
Expires	No	N/A
Key	Yes	Required: Yes This is the key of the destination object.

Request parameters/body	Supported	Description
x-amz-acl	Yes	This is the canned ACL to apply to the object. OneFS does not support aws-exec-read and log-delivery-write. Valid values: private public-read public-read-write authenticated-read bucket-owner-read bucket-owner-full-control
x-amz-copy-source	Yes	Required: Yes This is the name of the source bucket and key name of the source object
x-amz-copy-source-if-match	Yes	This copies the object if its ETag matches the specified tag.
x-amz-copy-source-if-modified-since	Yes	This copies the object if it has been modified since the specified time.
x-amz-copy-source-if-none-match	Yes	This copies the object if its ETag is different than the specified ETag.
x-amz-copy-source-if-unmodified-since	Yes	This copies the object if it has not been modified since the specified time.
x-amz-copy-source-server-side-encryption-customer-algorithm	No	N/A
x-amz-copy-source-server-side-encryption-customer-key	No	N/A
x-amz-copy-source-server-side-encryption-customer-key-MD5	No	N/A
x-amz-grant-full-control	Yes	This gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object.
x-amz-grant-read	Yes	This allows the grantee to read the object data and its metadata.
x-amz-grant-read-acp	Yes	This allows the grantee to read the object ACL.
x-amz-grant-write-acp	Yes	This allows the grantee to write the ACL for the applicable object.
x-amz-metadata-directive	Yes	This specifies whether the metadata is copied from the source object or replaced with metadata that is provided in the request. Valid values: COPY REPLACE
x-amz-object-lock-legal-hold	No	N/A
x-amz-object-lock-mode	No	N/A
x-amz-object-lock-retain-until-date	No	N/A

Request parameters/body	Supported	Description
x-amz-request-payer	No	N/A
x-amz-server-side-encryption	No	N/A
x-amz-server-side-encryption-aws-kms-key-id	No	N/A
x-amz-server-side-encryption-context	No	N/A
x-amz-server-side-encryption-customer-algorithm	No	N/A
x-amz-server-side-encryption-customer-key	No	N/A
x-amz-server-side-encryption-customer-key-MD5	No	N/A
x-amz-storage-class	No	N/A. OneFS ignores it and sets it to STANDARD only.
x-amz-tagging	No	N/A
x-amz-tagging-directive	No	N/A
x-amz-website-redirect-location	No	N/A

Note: Amazon S3 allows specifying a grantee using the following headers: email address, id, uri in the x-amz-grant-read, x-amz-grant-read-acp, x-amz-grant-write-acp, and x-amz-grant-full-control. OneFS does not support an email address to specify a grantee, and a 501 NotImplemented code is returned.

3.4 CreateMultipartUpload

This API Initiates a multipart upload and returns an upload ID. Table 14 shows the details about the OneFS S3 CreateMultipartUpload API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 14 OneFS S3 CreateMultipartUpload API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the destination bucket.
Cache-Control	No	N/A
Content-Disposition	No	N/A
Content-Encoding	No	N/A

Request parameters/body	Supported	Description
Content-Language	No	N/A
Content-Type	No	N/A. OneFS ignores it and sets it to binary/octet-stream only.
Expires	No	N/A
Key	Yes	Required: Yes This is the key of the destination object.
x-amz-acl	Yes	This is the standard ACL to apply to the object. OneFS does not support aws-exec-read and log-delivery-write. Valid values: private public-read public-read-write authenticated-read bucket-owner-read bucket-owner-full-control
x-amz-grant-full-control	Yes	This gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object.
x-amz-grant-read	Yes	This allows the grantee to read the object data and its metadata.
x-amz-grant-read-acp	Yes	This allows the grantee to read the object ACL.
x-amz-grant-write-acp	Yes	This allows the grantee to write the ACL for the applicable object.
x-amz-object-lock-legal-hold	No	N/A
x-amz-object-lock-mode	No	N/A
x-amz-object-lock-retain-until-date	No	N/A
x-amz-request-payer	No	N/A
x-amz-server-side-encryption	No	N/A
x-amz-server-side-encryption-aws-kms-key-id	No	N/A
x-amz-server-side-encryption-context	No	N/A
x-amz-server-side-encryption-customer-algorithm	No	N/A
x-amz-server-side-encryption-customer-key	No	N/A
x-amz-server-side-encryption-customer-key-MD5	No	N/A
x-amz-storage-class	No	N/A. OneFS ignores it and sets it to STANDARD only.
x-amz-tagging	No	N/A

Request parameters/body	Supported	Description
x-amz-website-redirect-location	No	N/A

Note: Amazon S3 allows specifying a grantee using the following headers: email address, id, uri in the x-amz-grant-read, x-amz-grant-read-acp, x-amz-grant-write-acp, and x-amz-grant-full-control. OneFS does not support an email address to specify a grantee, and a 501 NotImplemented code is returned.

3.5 DeleteObject

This API deletes a specific object in a bucket. Table 15 shows the details about the OneFS S3 DeleteObject API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 15 OneFS S3 DeleteObject API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket containing the object.
Key	Yes	Required: Yes This is the key name of the object to delete.
versionId	No	N/A
x-amz-bypass-governance-retention	No	N/A
x-amz-mfa	No	N/A
x-amz-request-payer	No	N/A

3.6 GetObject

This API retrieves objects from OneFS through the S3 protocol. If read permission is granted to the **nobody** user in OneFS, a client can retrieve the object without using an authorization header. Table 16 shows the details about the OneFS S3 GetObject API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 16 OneFS S3 GetObject API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the bucket name containing the object.
If-Match	Yes	This returns the object only if its ETag is the same as the one specified. Otherwise, it returns a 412 code (precondition failed).
If-Modified-Since	Yes	This returns the object only if it has been modified since the specified time. Otherwise, it returns a 304 code (not modified).
If-None-Match	Yes	This returns the object only if its ETag is different from the one specified. Otherwise, it returns a 304 code (not modified).
If-Unmodified-Since	Yes	This returns the object only if it has not been modified since the specified time. Otherwise, it returns a 412 code (precondition failed).
Key	Yes	Required: Yes This is the key of the object to get.
partNumber	No	N/A. A 510 NotImplemented code is returned.
Range	Yes	This gets the specified range bytes of an object. See article RFC2616 for more information about the HTTP Range header.
response-cache-control	No	N/A
response-content-disposition	No	N/A
response-content-encoding	No	N/A
response-content-language	No	N/A
response-content-type	No	N/A. OneFS ignores it and sets it to binary/octet-stream only.
response-expires	No	N/A
versionId	No	N/A
x-amz-request-payer	No	N/A
x-amz-server-side-encryption-customer-algorithm	No	N/A

Request parameters/body	Supported	Description
x-amz-server-side-encryption-customer-key	No	N/A
x-amz-server-side-encryption-customer-key-MD5	No	N/A

3.7 GetObjectAcl

This API returns the access control list (ACL) of an object. Table 17 shows the details about the OneFS S3 GetObjectAcl API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 17 OneFS S3 GetObjectAcl API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the bucket name that contains the object for which to get the ACL information.
Key	Yes	Required: Yes This is the key of the object for which to get the ACL information.
versionId	No	N/A
x-amz-request-payer	No	N/A

3.8 HeadObject

This API retrieves metadata from an object without returning the object data. Table 18 shows the details about the OneFS S3 HeadObject API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 18 OneFS S3 HeadObject API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the bucket name containing the object.
If-Match	Yes	This returns the object only if its ETag is the same as the one specified. Otherwise, this returns a 412 code (precondition failed).
If-Modified-Since	Yes	This returns the object only if it has been modified since the specified time. Otherwise, this returns a 304 code (not modified).

Request parameters/body	Supported	Description
If-None-Match	Yes	This returns the object only if its ETag is different from the one specified. Otherwise, this returns return a 304 code (not modified).
If-Unmodified-Since	Yes	This returns the object only if it has not been modified since the specified time. Otherwise, this returns a 412 code (precondition failed).
Key	Yes	Required: Yes This is the key of the object to get.
partNumber	No	N/A. A 510 NotImplemented code is returned.
Range	Yes	This gets the specified range bytes of an object. See article RFC2616 for more information about the HTTP Range header.
versionId	No	N/A
x-amz-request-payer	No	N/A
x-amz-server-side-encryption-customer-algorithm	No	N/A
x-amz-server-side-encryption-customer-key	No	N/A
x-amz-server-side-encryption-customer-key-MD5	No	N/A

3.9 ListParts

This API lists the parts that have been uploaded for a specific multipart upload. Table 19 shows the details about the OneFS S3 ListParts API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 19 OneFS S3 ListParts API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket to which the parts are being uploaded.
Key	Yes	Required: Yes This is the object key for which the multipart upload was initiated.
max-parts		This sets the maximum number of parts to return, from 1–1,000.
part-number-marker	Yes	This specifies the part after which listing should begin. Only parts with higher part numbers are listed. While the

Request parameters/body	Supported	Description
		response is truncated, the value can be set to the value of NextPartNumberMarker from response.
uploadId	Yes	Required: Yes This is the upload ID that identifies the multipart upload whose parts are being listed.
x-amz-request-payer	No	N/A

3.10 PutObject

Table 20 shows the details about the OneFS S3 PutObject API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 20 OneFS S3 PutObject API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the destination bucket.
Cache-Control	No	N/A
Content-Disposition	No	N/A
Content-Encoding	No	N/A
Content-Language	No	N/A
Content-Length	Yes	This is the size of the body in bytes.
Content-MD5	Yes	This is the base64-encoded, 128-bit MD5 digest of the data. OneFS uses the MD5 value from client as an ETag directly instead of calculating it by itself. If the MD5 is not specified in request, OneFS generates a unique string for that file as an ETag in response.
Content-Type	No	N/A. OneFS ignores it and sets it to binary/octet-stream only.
Expires	No	N/A
Key		Required: Yes This is the key of the destination object.
x-amz-acl	Yes	This is the standard ACL to apply to the object. OneFS does not support aws-exec-read and log-delivery-write. Valid values: private public-read public-read-write authenticated-read bucket-owner-read bucket-owner-full-control
x-amz-grant-full-control	Yes	This gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object.

Request parameters/body	Supported	Description
x-amz-grant-read	Yes	This allows the grantee to read the object data and its metadata.
x-amz-grant-read-acp	Yes	This allows the grantee to read the object ACL.
x-amz-grant-write-acp	Yes	This allows the grantee to write the ACL for the applicable object.
x-amz-object-lock-legal-hold	No	N/A
x-amz-object-lock-mode	No	N/A
x-amz-object-lock-retain-until-date	No	N/A
x-amz-request-payer	No	N/A
x-amz-server-side-encryption	No	N/A
x-amz-server-side-encryption-aws-kms-key-id	No	N/A
x-amz-server-side-encryption-context	No	N/A
x-amz-server-side-encryption-customer-algorithm	No	N/A
x-amz-server-side-encryption-customer-key	No	N/A
x-amz-server-side-encryption-customer-key-MD5	No	N/A
x-amz-storage-class	No	N/A. OneFS ignores it and sets it to STANDARD only.
x-amz-tagging	No	N/A
x-amz-website-redirect-location	No	N/A

Note: Amazon S3 allows specifying a grantee using the following headers: email address, id, uri in the x-amz-grant-read, x-amz-grant-read-acp, x-amz-grant-write-acp, and x-amz-grant-full-control. OneFS does not support an email address to specify a grantee, and a 501 NotImplemented code is returned.

3.11 PutObjectAcl

This API sets the permissions on an existing object using ACLs. Table 21 shows the details about the OneFS S3 PutObjectACL API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 21 OneFS S3 PutObjectACL API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket containing the objects.
Content-MD5	Yes	This is the base64-encoded 128-bit MD5 digest of the data. OneFS uses the MD5 value from the client as an ETag directly instead of calculating it by itself. If the MD5 is not specified in request, OneFS generates a unique string for that file as an ETag in response.
Key	Yes	Required: Yes This is the key name of the object to set the ACL.
versionId	No	N/A
x-amz-acl	Yes	This is the standard ACL to apply to the object. OneFS does not support aws-exec-read and log-delivery-write. Valid values: private public-read public-read-write authenticated-read bucket-owner-read bucket-owner-full-control
x-amz-grant-full-control	Yes	This gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object.
x-amz-grant-read	Yes	This allows the grantee to read the object data and its metadata.
x-amz-grant-read-acp	Yes	This allows the grantee to read the object ACL.
x-amz-grant-write-acp	Yes	This allows the grantee to write the ACL for the applicable object.

Note: Amazon S3 allows specifying a grantee using the following headers: email address, id, uri in the x-amz-grant-read, x-amz-grant-read-acp, x-amz-grant-write-acp, and x-amz-grant-full-control. OneFS does not support an email address to specify a grantee, and a 501 NotImplemented code is returned.

3.12 UploadPart

This API uploads a part in a multipart upload. Each part must be at least 5 MB in size, except for the last part. The maximum size of each part is 5 GB. Table 22 shows the details about the OneFS S3 UploadPart API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 22 OneFS S3 UploadPart API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket containing the objects.
Content-Length	Yes	This is the size of the body in bytes.
Content-MD5	Yes	This is the base64-encoded, 128-bit MD5 digest of the data. OneFS uses the MD5 value from the client as an ETag directly instead of calculating it by itself. If the MD5 is not specified in request, OneFS generates a unique string for that file as an ETag in response.
Key	Yes	Required: Yes This is the object key for which the multipart upload is initiated.
partNumber	Yes	Required: Yes This is the part number of the part being uploaded. This is a positive integer between 1–10,000.
uploadId	Yes	Required: Yes This is the upload ID that identifies the multipart upload whose part is being uploaded.
x-amz-request-payer	No	N/A
x-amz-server-side-encryption-customer-algorithm	No	N/A
x-amz-server-side-encryption-customer-key	No	N/A
x-amz-server-side-encryption-customer-key-MD5	No	N/A

3.13 UploadPartCopy

This API uploads a part by copying data from an existing object as the data source. Each part must be at least 5 MB in size, except for the last part. The maximum size of each part is 5 GB. Table 23 shows the details about the OneFS S3 UploadPartCopy API request parameters and request body. If not specified, all unsupported request parameters and the request body are silently ignored by OneFS without an error code being returned to the client.

Table 23 OneFS S3 UploadPartCopy API request parameters

Request parameters/body	Supported	Description
Bucket	Yes	Required: Yes This is the name of the bucket containing the objects.
Key	Yes	Required: Yes This is the object key for which the multipart upload is initiated.
partNumber	Yes	Required: Yes This is the part number of the part being uploaded. This is a positive integer between 1– 10,000.
uploadId	Yes	Required: Yes This is the upload ID that identifies the multipart upload whose part is being copied.
x-amz-copy-source	Yes	Required: Yes This is the name of the source bucket and key name of the source object.
x-amz-copy-source-if-match	Yes	This copies the object if its ETag matches the specified tag.
x-amz-copy-source-if-modified-since	Yes	This copies the object if it has been modified since the specified time.
x-amz-copy-source-if-none-match	Yes	This copies the object if its ETag is different than the specified ETag.
x-amz-copy-source-if-unmodified-since	Yes	This copies the object if it has not been modified since the specified time.
x-amz-copy-source-range	Yes	This is the range of bytes to copy from the source object.
x-amz-copy-source-server-side-encryption-customer-algorithm	No	N/A
x-amz-copy-source-server-side-encryption-customer-key	No	N/A
x-amz-copy-source-server-side-encryption-customer-key-MD5	No	N/A

Request parameters/body	Supported	Description
x-amz-request-payer	No	N/A
x-amz-server-side-encryption-customer-algorithm	No	N/A
x-amz-server-side-encryption-customer-key	No	N/A
x-amz-server-side-encryption-customer-key-MD5	No	N/A

4 OneFS S3 limitations

This section addresses the limitations of the OneFS S3 implementation. It is recommended to take these limitations into consideration when designing an application to work with OneFS S3.

Table 24 shows the details about OneFS S3 limitations.

Table 24 OneFS S3 limitations

Feature	Limitation
Object versioning	OneFS does not support Amazon S3 object versioning. It is recommended to use OneFS SnapshotIQ as an alternative method.
Chunked request	Transferring a payload in multiple chunks is not supported. See the article chunked request in Amazon documentation.
Object lock	OneFS does not support Amazon S3 object lock. It is recommended to use OneFS SmartLock as an alternative solution to meet compliance requirements.
Object key delimiter	OneFS only supports using a slash (/) as the delimiter.
Number of buckets	There are 1,000 buckets per user and 40,000 per cluster.
User-defined metadata	<ul style="list-style-type: none"> • The key of user-defined metadata consists of a maximum of 200 Bytes of UTF-8 encoded, case-sensitive, alphanumeric characters, the period (.), and the underscore (_) characters. • The value of user-defined metadata is not more than 1,024 bytes. • At most, 128 user-metadata are allowed for an object. • The total size of the HTTP header (including user-defined metadata and other headers) may not exceed 8 KB in OneFS. The total size of user-defined metadata is limited and varies depending on the actual HTTP request.
Bucket traversal	An S3 user must traverse or execute permissions on all elements of the path to reach an object in the OneFS directory hierarchy.
Object size	An object may not exceed 16 TiB, which is aligned with the OneFS file system.

A OneFS S3 extended-request parameter examples

A.1 x-isi-path extended header

When creating a bucket through S3, OneFS provides an optional S3 extension to specify a OneFS directory as a bucket path. The following is an example of adding the extended header through boto3.

```
import boto3
HOST=<ip/fqdn> # Your SmartConnect name or cluster IP goes here
USERNAME='1_local_user01_accid' # Your access ID
USERKEY='mWQbXkadl2CR_x2_WRj4tYu_d11j' # Your secret key
URL = 'http://{ }:9020'.format(HOST)
s3 = boto3.resource('s3')
session = boto3.Session()
s3client =
session.client(service_name='s3',aws_access_key_id=USERNAME,aws_secret_access_key=USERKEY,endpoint_url=URL,use_ssl=False,verify=False)
bucket_name='bucket01'
bucket_path = "/ifs/data/s3buckets/{ }".format(bucket_name)
headers = {'x-isi-path': bucket_path}

# pass in custom headers before CreateBucket call
add_headers = (lambda **kwargs: kwargs['params']['headers'].update(headers))
s3client.meta.events.register('before-call.s3.CreateBucket', add_headers)

s3client.create_bucket(Bucket=bkt_name)
```

A.2 x-isi-force-delete extended header

By default, a bucket cannot be deleted if it is not empty. With the x-isi-force-delete extension, a bucket can be deleted from OneFS while preserving the data under the bucket. This option is effective if it is contained in a request. A value does not have to be assigned for this header, and an empty string is acceptable. The following is an example of adding the extended header through boto3.

```
import boto3
HOST=<ip/fqdn> # Your SmartConnect name or cluster IP goes here
USERNAME='1_local_user01_accid' # Your access ID
USERKEY='mWQbXkadl2CR_x2_WRj4tYu_d11j' # Your secret key
URL = 'http://{ }:9020'.format(HOST)
s3 = boto3.resource('s3')
session = boto3.Session()
s3client =
session.client(service_name='s3',aws_access_key_id=USERNAME,aws_secret_access_key=USERKEY,endpoint_url=URL,use_ssl=False,verify=False)
bucket_name='bucket01'
headers = {'x-isi-force-delete': ''}

# pass in custom headers before DeleteBucket call
```

OneFS S3 extended-request parameter examples

```
add_headers = (lambda **kwargs: kwargs['params']['headers'].update(headers))
s3client.meta.events.register('before-call.s3.DeleteBucket', add_headers)

s3client.delete_bucket(Bucket=bkt_name)
```

B Technical support and resources

[Dell.com/support](https://www.dell.com/support) is focused on meeting customer needs with proven services and support.

[Storage technical documents and videos](#) provide expertise that helps to ensure customer success on Dell Technologies storage platforms.
